# Package

# org.ow2.bonita.facade

Nova Bonita Workflow APIs for handling workflow definition, deployment, execution and history. Nova Bonita is the name of new version of Bonita v4.

Nova technology is based on the Process Virtual Machine conceptual model for processes. The Process Virtual Machine defines a generic process engine enabling support for multiple process languages (such BPEL, XPDL).

Nova Bonita M3 is an extensible and embeddable workflow solution that can be easily deployed in both standard (JSE) and Enterprise (JEE) environments.

- Nova Bonita can be easily integrated in your application as a workflow library. In that case your application can directly reach the workflow APIs as POJOs.
- Nova Bonita can also be deployed in a JEE application server and so leverage it remotely thanks to the Workflow Session Beans APIs.

As a example of this, Nova Bonita provides a default JEE integration with a EJB3 lightweight container such [Easybeans](#). You can easily deploy Nova Bonita in another JEE application server by just deploying the bonita.ear file in your favorite application server.

Nova Bonita APIs are divided into 5 different areas:

- [DefinitionAPI](#): to get definition workflow data for packages, processes, activities, role mappers, ....
- [RuntimeReadOnlyAPI](#): to get tasks (aka manual activities) for the authenticated user as well to get/list variables in a particular or a set of workflow instances.
- [RuntimeAPI](#): to manage process, instance and task life cycle operations as well as to set/updates variables.
- [QueryAPI](#): to get recorded/runtime informations for packages, processes, instances, activities, tasks (will add support for dynamic queries in the future).
- [DeployerAPI](#): to deploy workflow processes into the engine. XPDL files and advanced entities such hooks, mappers and performer assignments can be deployed individually or in one shot.

Nova Bonita Use Case 1: Bonita used as a java library inside your application

The java APIs can be accessed thru an API accessor object as described in the above example.

```
APIAccessorImpl accessor = new APIAccessorImpl();
RuntimeAPI runtimeAPI = accessor.getRuntimeAPI();
ReadOnlyAPIAccessorImpl accessorRO = new ReadOnlyAPIAccessorImpl();
RuntimeReadOnlyAPI RuntimeReadOnlyAPI = accessorRO.getRuntimeAPI();
```

There are 2 different accessor interfaces available:

- [ReadOnlyAPIAccessor](#): to get access to DefinitionAPI, RuntimeReadOnlyAPI, QueryAPI interfaces.
- [APIAccessor](#): to get access to RuntimeAPI, DeployerAPI interfaces.

APIAccessorImpl and ReadOnlyAPIAccessorImpl classes implements those interfaces.

Instantiation of these classes gives access to the expected bonita API.

Nova Bonita Use Case 2: Bonita used as a server application

The session Bean APIs can be accessed by simply executing a lookup on the expected API interface. The jndi name is the name of the java interface.

```
RuntimeAPI runtimeAPI = (RuntimeAPI) initialContext.lookup("runtimeAPI");
RuntimeReadOnlyAPI runtimeReadOnlyAPI =
(RuntimeReadOnlyAPI) initialContext.lookup("RuntimeReadOnlyAPI");
```

Note:

- Authentication action has to be performed before getting the API interface.
- To package and deploy Bonita within the Easybeans EJB 3 container, see the documentation into the package (you could extrapolate those instructions to any other JEE application server).
- A complete example (Approval Workflow) illustrating both standard and enterprise deployments is provided into the delivered package (available under Nova\_Bonita\_Install\_Directory/examples/approvalWorkflow).

# org.ow2.bonita.facade Interface APIAccessor

All Superinterfaces:

[ReadOnlyAPIAccessor](#)

All Known Implementing Classes:

[APIAccessorImpl](#)

---

public interface **APIAccessor**  
extends [ReadOnlyAPIAccessor](#)

Helper class giving access to DeployerAPI and QueryAPI interfaces.

## Method Summary

<a href="#">DeployerAPI</a>	<a href="#">getDeployerAPI()</a> To get the DeployerAPI interface.
<a href="#">RuntimeAPI</a>	<a href="#">getRuntimeAPI()</a> To get the RuntimeAPI interface.

### Methods inherited from interface [org.ow2.bonita.facade.ReadOnlyAPIAccessor](#)

[getDefinitionAPI](#), [getQueryAPI](#), [getRuntimeAPI](#)

## Methods

### getRuntimeAPI

public [RuntimeAPI](#) [getRuntimeAPI\(\)](#)

To get the RuntimeAPI interface.

**Returns:**

the interface RuntimeAPI.

---

### getDeployerAPI

public [DeployerAPI](#) [getDeployerAPI\(\)](#)

To get the DeployerAPI interface.

**Returns:**

the interface DeployerAPI.

## org.ow2.bonita.facade Class APIInterceptor

```
java.lang.Object
+-org.ow2.bonita.facade.APIInterceptor
```

**All Implemented Interfaces:**  
java.io.Serializable, InvocationHandler

```
public class APIInterceptor
extends Object
implements InvocationHandler, java.io.Serializable
```

### Nested Class Summary

class	<a href="#">APIInterceptor.Context</a> APIInterceptor.Context
-------	--

### Field Summary

private	<a href="#">api</a>
private static final	<a href="#">CONTEXT</a>
protected static final	<a href="#">LOG</a>

### Constructor Summary

public	<a href="#">APIInterceptor(Object api)</a>
--------	--

### Method Summary

Object	<a href="#">invoke(Object proxy, Method method, Object[] args)</a>
void	<a href="#">setSecurityContext()</a>

### Fields

#### LOG

```
protected static final java.util.logging.Logger LOG
```

(continued from last page)

## CONTEXT

```
private static final org.ow2.bonita.facade.APIInterceptor.Context CONTEXT
```

---

### api

```
private java.lang.Object api
```

## Constructors

### APIInterceptor

```
public APIInterceptor(Object api)
```

## Methods

### invoke

```
public Object invoke(Object proxy,
                     Method method,
                     Object[] args)
throws org.ow2.bonita.util.BonitaException
```

---

### setSecurityContext

```
private void setSecurityContext()
```

## org.ow2.bonita.facade Class APIInterceptor.Context

```
java.lang.Object
  +-java.lang.Enum
    +-org.ow2.bonita.facade.APIInterceptor.Context
```

### All Implemented Interfaces:

java.io.Serializable, Comparable

public static final class **APIInterceptor.Context**

extends Enum

### Field Summary

public static final	<a href="#">EJB</a>
---------------------	---------------------

public static final	<a href="#">Standard</a>
---------------------	--------------------------

### Fields inherited from class java.lang.Enum

name, ordinal
---------------

### Constructor Summary

private	<a href="#">APIInterceptor.Context()</a>
---------	--

### Method Summary

static <a href="#">APIInterceptor.Context</a>	<a href="#">valueOf(String name)</a>
--	--------------------------------------

static <a href="#">APIInterceptor.Context</a>	<a href="#">values()</a>
--	--------------------------

### Fields

#### Standard

public static final org.ow2.bonita.facade.APIInterceptor.Context **standard**

#### EJB

public static final org.ow2.bonita.facade.APIInterceptor.Context **EJB**

(continued from last page)

## Constructors

### APIInterceptor.Context

```
private APIInterceptor.Context()
```

## Methods

### values

```
public final static APIInterceptor.Context[] values()
```

---

### valueOf

```
public static APIInterceptor.Context valueOf(String name)
```

# org.ow2.bonita.facade Interface DefinitionAPI

All Known Implementing Classes:

[DefinitionAPIImpl](#)

public interface **DefinitionAPI**

extends

Getters on the workflow definition data for: packages, processes, activities, participants, dataFields, transitions hooks, mappers, performer assignments.

This interface could be considered as complementary to the QueryAPI interface. For this interface the returned data represents static part of managed workflow elements.

Workflow data can be retrieved with both entities ids or names.

## Method Summary

<a href="#">PackageDef</a>	<a href="#">getDeployedPackage</a> (String packageId)
Set	<a href="#">getDeployedPackages</a> ()
<a href="#">ProcessDef</a>	<a href="#">getDeployedProcess</a> (String processId)
Set	<a href="#">getDeployedProcesses</a> ()
<a href="#">PackageDef</a>	<a href="#">getLastPackage</a> (String packageId) Return the last deployed package for the specified package id.
<a href="#">ProcessDef</a>	<a href="#">getLastProcess</a> (String processId) Return the last deployed process for the specified process id.
<a href="#">PackageDef</a>	<a href="#">getPackage</a> (String packageId, String deploymentId) Returns the package definition for the specified package and deployment.
String	<a href="#">getPackageId</a> (String deploymentId, String packageName) Returns the package id for the specified package name and deployment id.
<a href="#">ProcessDef</a>	<a href="#">getPackageProcess</a> (String packageId, String deploymentId, String processId) Returns the process information for the specified package and deployment and process.
Set	<a href="#">getPackageProcesses</a> (String packageId, String deploymentId) Returns the set of definition information of all processes within the specified deployed package and the specified deployment.
Set	<a href="#">getPackages</a> () Returns the set of definition informations for all deployed packages.
Set	<a href="#">getPackages</a> (String packageId) Returns the set of definition informations for all deployed packages for the specified package.
<a href="#">ProcessDef</a>	<a href="#">getProcess</a> (String processId, String deploymentId) Returns the process definition for the specified process id and deployment id.

Set	<a href="#"><u>getProcessActivities</u></a> (String processId, String deploymentId) Returns the set of definition for process activities of the specified process and deployment.
<a href="#"><u>ActivityDef</u></a>	<a href="#"><u>getProcessActivity</u></a> (String processId, String deploymentId, String activityId) Returns the definition for process activity of the specified process and deployment.
String	<a href="#"><u>getProcessActivityId</u></a> (String processId, String deploymentId, String activityName) Returns the activity id for the specified process id and deployment id and activity id.
Set	<a href="#"><u>getProcesses</u></a> () Returns the set of definition information of all deployed processes.
Set	<a href="#"><u>getProcesses</u></a> (String processId) Returns the set of definition informations for the process with the specified id.
String	<a href="#"><u>getProcessId</u></a> (String deploymentId, String processName) Returns the process id for the specified process name and deployment id.
<a href="#"><u>ParticipantDef</u></a>	<a href="#"><u>getProcessParticipant</u></a> (String processId, String deploymentId, String participantId) Returns the participant definition for the specified process and deployment.
String	<a href="#"><u>getProcessParticipantId</u></a> (String processId, String deploymentId, String participantName) Returns the participant id for the specified process id and deployment id and participant name.
Set	<a href="#"><u>getProcessParticipants</u></a> (String processId, String deploymentId) Returns the set of participant definitions for the specified process and deployment.

## Methods

### getPackages

```
public Set getPackages()
```

Returns the set of definition informations for all deployed packages.

**Returns:**

a set of PackageDef in unspecified order that have been deployed.

**Throws:**

BonitaInternalException - if an exception occurs.

### getPackages

```
public Set getPackages(String packageId)
```

Returns the set of definition informations for all deployed packages for the specified package.

**Parameters:**

packageId - the package id.

**Returns:**

a set of PackageDef in unspecified order that have been deployed for the package with specified packageId.

(continued from last page)

**Throws:**

BonitaInternalException - if an exception occurs.

---

## getPackage

```
public PackageDef getPackage(String packageId,  
                           String deploymentId)
```

Returns the package definition for the specified package and deployment.

**Parameters:**

packageId - the package id.  
deploymentId - the deployment id.

**Returns:**

a packageDef interface.

**Throws:**

BonitaInternalException - if an exception occurs.

---

## getDeployedPackages

```
public Set getDeployedPackages()
```

---

## getDeployedPackage

```
public PackageDef getDeployedPackage(String packageId)
```

---

## getPackageProcesses

```
public Set getPackageProcesses(String packageId,  
                           String deploymentId)
```

Returns the set of definition information of all processes within the specified deployed package and the specified deployment.

**Parameters:**

packageId - the package id.  
deploymentId - the deployment id.

**Returns:**

set of ProcessDef of all the processes within the specified deployed package and the specified deployment.

**Throws:**

BonitaInternalException - if an exception occurs.

---

## getPackageProcess

```
public ProcessDef getPackageProcess(String packageId,  
                           String deploymentId,  
                           String processId)
```

Returns the process information for the specified package and deployment and process.

**Parameters:**

(continued from last page)

packageId - the package id.  
deploymentId - the deployment id.  
processId - the process id.

**Returns:**

the ProcessDef interface for the specified package and deployment and process.

**Throws:**

BonitaInternalException - if an exception occurs.

---

## getProcesses

```
public Set getProcesses( )
```

Returns the set of definition information of all deployed processes.

**Returns:**

set of ProcessDef of all deployed processes.

**Throws:**

BonitaInternalException - if an exception occurs.

---

## getProcesses

```
public Set getProcesses(String processId)
```

Returns the set of definition informations for the process with the specified id. These process informations are searched into the current recorded informations and into the archived informations. A process with a given id could have been deployed and undeployed several times.

**Returns:**

set of ProcessDef of the specified process id.

**Throws:**

BonitaInternalException - if an exception occurs.

---

## getProcess

```
public ProcessDef getProcess(String processId,  
                           String deploymentId)
```

Returns the process definition for the specified process id and deployment id.

**Parameters:**

processId - the process id.  
deploymentId - the deployment id.

**Returns:**

the ProcessDef interface for the specified process id and deployment id.

**Throws:**

BonitaInternalException - if an exception occurs.

---

## getDeployedProcesses

```
public Set getDeployedProcesses( )
```

## getDeployedProcess

```
public ProcessDef getDeployedProcess(String processId)
```

---

## getProcessParticipants

```
public Set getProcessParticipants(String processId,  
                               String deploymentId)
```

Returns the set of participant definitions for the specified process and deployment.

**Parameters:**

processId - the process id.  
deploymentId - the deployment id.

**Returns:**

the set of ParticipantDef for the specified process id and deployment id.

---

## getProcessParticipant

```
public ParticipantDef getProcessParticipant(String processId,  
                                         String deploymentId,  
                                         String participantId)
```

Returns the participant definition for the specified process and deployment.

**Parameters:**

processId - the process id.  
deploymentId - the deployment id.  
participantId - the participant id.

**Returns:**

the ParticipantDef for the specified process id and deployment id and participant id.

---

## getProcessActivities

```
public Set getProcessActivities(String processId,  
                               String deploymentId)
```

Returns the set of definition for process activities of the specified process and deployment.

**Parameters:**

processId - the process id.  
deploymentId - the deployment id.

**Returns:**

the set of ActivityDef for the specified process id and deployment id.

---

## getProcessActivity

```
public ActivityDef getProcessActivity(String processId,  
                                         String deploymentId,  
                                         String activityId)
```

Returns the definition for process activity of the specified process and deployment.

(continued from last page)

**Parameters:**

processId - the process id.  
deploymentId - the deployment id.  
activityId - the activity id.

**Returns:**

the ActivityDef for the specified process id and deployment id and activity id.

---

## getPackageId

```
public String getPackageId(String deploymentId,  
                           String packageName)
```

Returns the package id for the specified package name and deployment id.

**Parameters:**

deploymentId - the deployment id.  
packageName - the package name.

**Returns:**

the package id for the specified package name and deployment id.

---

## getProcessId

```
public String getProcessId(String deploymentId,  
                           String processName)
```

Returns the process id for the specified process name and deployment id.

**Parameters:**

deploymentId - the deployment id.  
processName - the process name.

**Returns:**

the process id for the specified process name and deployment id.

---

## getProcessActivityId

```
public String getProcessActivityId(String processId,  
                                   String deploymentId,  
                                   String activityName)
```

Returns the activity id for the specified process id and deployment id and activity id.

**Parameters:**

processId - the process id.  
deploymentId - the deployment id.  
activityName - the activity name.

**Returns:**

the activity id for the specified process id and deployment id and activity id.

---

## getProcessParticipantId

```
public String getProcessParticipantId(String processId,  
                                      String deploymentId,  
                                      String participantName)
```

Returns the participant id for the specified process id and deployment id and participant name.

(continued from last page)

**Parameters:**

processId - the process id.  
deploymentId - the deployment id.  
participantName - the participant name.

**Returns:**

the participant id for the specified process id and deployment id and participant name.

---

## getLastPackage

```
public PackageDef getLastPackage(String packageId)
```

Return the last deployed package for the specified package id.

**Parameters:**

packageId - the package id.

**Returns:**

the last deployed package for the specified package id.

---

## getLastProcess

```
public ProcessDef getLastProcess(String processId)
```

Return the last deployed process for the specified process id.

**Parameters:**

processId - the process id.

**Returns:**

the last deployed process for the specified process id.

# org.ow2.bonita.facade Interface DeployerAPI

All Known Implementing Classes:

[DeployerAPIImpl](#)

public interface **DeployerAPI**

extends

Workflow process deployment operations. Individual or grouped deployment of objects relating to the process definition: xpdl file, java classes for hooks, mappers, performer assignments, ....

## Method Summary

org.ow2.bonita.deployment.PackageKey	<a href="#">deploy</a> (org.ow2.bonita.deployment.Deployment deployment) To deploy the package giving the deployment object.
org.ow2.bonita.deployment.PackageKey	<a href="#">deployBar</a> (byte[] barFile) To deploy the package giving the bytes table of the bar file.
org.ow2.bonita.deployment.PackageKey	<a href="#">deployBar</a> (java.io.File barFile) To deploy the package giving the file of the bar file.
org.ow2.bonita.deployment.PackageKey	<a href="#">deployBar</a> (java.io.InputStream barFileInputStream) To deploy the package giving the input stream of the bar file.
org.ow2.bonita.deployment.PackageKey	<a href="#">deployBar</a> (java.net.URL barFileURL) To deploy the package giving the URL of the bar file.
void	<a href="#">deployClass</a> (String className, byte[] clazz) To deploy a class giving its bytes table.
void	<a href="#">deployClasses</a> (Map classes) To deploy several classes giving a map of classes.
void	<a href="#">deployClassesInJar</a> (byte[] classesArchive) To deploy several classes giving an archive containing the classes.
void	<a href="#">removeClass</a> (String className) To remove a class giving the class name.
void	<a href="#">removeClasses</a> (String[] className) To remove classes giving the class names.
void	<a href="#">undeploy</a> (String packageId) To undeploy a package.

## Methods

### deploy

```
public org.ow2.bonita.deployment.PackageKey
deploy(org.ow2.bonita.deployment.Deployment deployment)
```

(continued from last page)

To deploy the package giving the deployment object.

**Parameters:**

deployment - the deployment object that should contain the xpdl file and the map of required.

**Returns:**

PackageKey the package key.

**Throws:**

BonitaInternalException - if an exception occurs.

---

## deployBar

```
public org.ow2.bonita.deployment.PackageKey deployBar(java.net.URL barFileURL)
throws DeploymentException
```

To deploy the package giving the URL of the bar file.

**Parameters:**

barFileURL - the URL of the bar file.

**Returns:**

PackageKey the package key.

**Throws:**

[DeploymentException](#) - if an IO exception is thrown.

BonitaInternalException - if an other exception occurs.

---

## deployBar

```
public org.ow2.bonita.deployment.PackageKey deployBar(java.io.File barFile)
throws DeploymentException
```

To deploy the package giving the file of the bar file.

**Parameters:**

barFile - the file of the barfile.

**Returns:**

PackageKey the package key.

**Throws:**

[DeploymentException](#) - if the archive file is not found.

BonitaInternalException - if an other exception occurs.

---

## deployBar

```
public org.ow2.bonita.deployment.PackageKey deployBar(byte[] barFile)
throws DeploymentException
```

To deploy the package giving the bytes table of the bar file.

**Parameters:**

barFile - the bytes table of the bar file.

**Returns:**

PackageKey the package key.

**Throws:**

(continued from last page)

[DeploymentException](#) - if either the xpdl file does not exist or is not unique or a malformed URL has occurred.  
[BonitaInternalException](#) - if an other exception occurs.

---

## deployBar

```
public org.ow2.bonita.deployment.PackageKey deployBar(java.io.InputStream  
barFileInputStream)  
throws DeploymentException
```

To deploy the package giving the input stream of the bar file.

**Parameters:**

barFileInputStream - the input stream of the bar file.

**Returns:**

PackageKey the package key.

**Throws:**

[DeploymentException](#) - if an IO exception is thrown.  
[BonitaInternalException](#) - if an other exception occurs.

---

## deployClass

```
public void deployClass(String className,  
byte[] clazz)  
throws DeploymentException
```

To deploy a class giving its bytes table.

**Parameters:**

className - the name of the class.  
clazz - the bytes table of the class.

**Throws:**

[DeploymentException](#) - if there is already a deployed class with this name.  
[BonitaInternalException](#) - if an other exception occurs.

---

## deployClasses

```
public void deployClasses(Map classes)  
throws DeploymentException
```

To deploy several classes giving a map of classes.

**Parameters:**

classes - a map of key-value where key is the name of the class and value is the bytes table.

**Throws:**

[DeploymentException](#) - if there is already a deployed class with the name  
[BonitaInternalException](#) - if an other exception occurs.

---

## deployClassesInJar

```
public void deployClassesInJar(byte[] classesArchive)  
throws DeploymentException
```

To deploy several classes giving an archive containing the classes.

**Parameters:**

classesArchive - the archives containing the classes.

(continued from last page)

**Throws:**

[DeploymentException](#) - if there is already a deployed class with this name or there's an IOException occurs.  
[BonitaInternalException](#) - if an other exception occurs.

---

## undeploy

```
public void undeploy(String packageId)
```

To undeploy a package.

**Parameters:**

packageId - the package id.

**Throws:**

[BonitaInternalException](#) - if an exception occurs.

---

## removeClass

```
public void removeClass(String className)
throws DeploymentException
```

To remove a class giving the class name.

**Parameters:**

className - the name of the class.

**Throws:**

[DeploymentException](#) - if there's no class defined in global class repository with this name or a package is still using global class.  
[BonitaInternalException](#) - if an other exception occurs.

---

## removeClasses

```
public void removeClasses(String[] className)
throws DeploymentException
```

To remove classes giving the class names.

**Parameters:**

className - the class names.

**Throws:**

[DeploymentException](#) - if there's no class defined in global class repository with this name or a package is still using global class.  
[BonitaInternalException](#) - if an other exception occurs.

---

# org.ow2.bonita.facade Interface QueryAPI

All Known Implementing Classes:  
[QueryAPIImpl](#)

public interface **QueryAPI**

extends

Getters on workflow recorded data. Operations in this API applies to main entities managed by Nova Bonita such as: packages, processes, process instances, activities, tasks. Returned records are issued from recorded runtime informations (both runtime and archived workflow instances).

## Method Summary

Map	<a href="#"><code>getActivities(String instanceId)</code></a> Returns all records of activity for the given instance id.
org.ow2.bonita.services.record.ActivityRecord	<a href="#"><code>getActivity(String instanceId, String activityId)</code></a> Returns the record of the activity with the given instance id and activity id.
org.ow2.bonita.services.record.InstanceRecord	<a href="#"><code>getInstance(String instanceId)</code></a> Returns the record of the instance with the given id.
Map	<a href="#"><code>getInstances(String processId)</code></a> Returns all records of instance for the given process id.
org.ow2.bonita.services.record.TaskRecord	<a href="#"><code>getTask(String taskId)</code></a> Returns the record of the task with the given task id.
Map	<a href="#"><code>getTasks(String instanceId)</code></a> Returns all records of task for the given instance id.

## Methods

### getInstance

public org.ow2.bonita.services.record.InstanceRecord [`getInstance\(String instanceId\)`](#)

Returns the record of the instance with the given id.

**Parameters:**

instanceId - the instance id.

**Returns:**

the record of the instance with the given id.

**Throws:**

BonitaInternalException - if an exception occurs.

(continued from last page)

## getInstances

```
public Map getInstances(String processId)
```

Returns all records of instance for the given process id.

**Parameters:**

processId - the process id.

**Returns:**

the map containing all instance records. Key is the id of the instance. Value is the record for the instance.

**Throws:**

BonitaInternalException - if an exception occurs.

---

## getActivity

```
public org.ow2.bonita.services.record.ActivityRecord getActivity(String instanceId,  
String activityId)
```

Returns the record of the activity with the given instance id and activity id.

**Parameters:**

instanceId - the instance id.  
activityId - the activity id.

**Returns:**

the record activity with the given instance id and activity id.

**Throws:**

BonitaInternalException - if an exception occurs.

---

## getActivities

```
public Map getActivities(String instanceId)
```

Returns all records of activity for the given instance id.

**Parameters:**

instanceId - the instance id.

**Returns:**

the map containing activity records. Key is the id of the activity. Value is the record for the activity.

**Throws:**

BonitaInternalException - if an exception occurs.

---

## getTask

```
public org.ow2.bonita.services.record.TaskRecord getTask(String taskId)
```

Returns the record of the task with the given task id.

**Parameters:**

taskId - the task id.

**Returns:**

the record of the task with the given task id.

(continued from last page)

**Throws:**

BonitaInternalException - if an exception occurs.

---

## getTasks

```
public Map getTasks(String instanceId)
```

Returns all records of task for the given instance id.

**Parameters:**

instanceId - the instance id.

**Returns:**

the map containing all task records. Key is the id of the task. Value is the record for the task.

**Throws:**

BonitaInternalException - if an exception occurs.

# org.ow2.bonita.facade Interface ReadOnlyAPIAccessor

All Subinterfaces:

[APIAccessor](#)

All Known Implementing Classes:

[ReadOnlyAPIAccessorImpl](#)

public interface **ReadOnlyAPIAccessor**

extends

Helper class giving access to DeployerAPI, QueryAPI and getRuntimeReadOnlyAPI interfaces.

## Method Summary

<a href="#">DefinitionAPI</a>	<a href="#">getDefinitionAPI()</a> To get the DefinitionAPI interface.
<a href="#">QueryAPI</a>	<a href="#">getQueryAPI()</a> To get the QueryAPI interface.
<a href="#">RuntimeReadOnlyAPI</a>	<a href="#">getRuntimeAPI()</a> To get the RuntimeReadOnlyAPI interface.

## Methods

### getRuntimeAPI

public [RuntimeReadOnlyAPI](#) **getRuntimeAPI()**

To get the RuntimeReadOnlyAPI interface.

**Returns:**

the interface RuntimeReadOnlyAPI.

### getQueryAPI

public [QueryAPI](#) **getQueryAPI()**

To get the QueryAPI interface.

**Returns:**

the interface QueryAPI.

### getDefinitionAPI

public [DefinitionAPI](#) **getDefinitionAPI()**

To get the DefinitionAPI interface.

**Returns:**

the interface DefinitionAPI.

# org.ow2.bonita.facade Interface RuntimeAPI

## All Superinterfaces:

[RuntimeReadOnlyAPI](#)

## All Known Implementing Classes:

[RuntimeAPIImpl](#)

public interface **RuntimeAPI**  
extends [RuntimeReadOnlyAPI](#)

Main API responsible of workflow state change operations. Those operations concerns tasks, process instances and variables.  
Default states for tasks (aka manual activities), processes instances, activities and processes are:

- States for task: INITIAL, READY, EXECUTING, SUSPENDED, FINISHED
- States for activities: INITIAL, READY, EXECUTING, FINISHED, DEAD
- States for process instance: INITIAL, STARTED, FINISHED
- States for process: UNDEPLOYED, DEPLOYED

## Method Summary

void	<a href="#">deleteAllInstances</a> (String processId) This method is only dedicated for bonita unit tests!
void	<a href="#">deleteInstance</a> (String instanceId) This method is only dedicated for bonita unit tests!
void	<a href="#">finishTask</a> (String taskId) Finish the task.
String	<a href="#">instantiateProcess</a> (String processId) Create an instance of the specified process and start the execution.
String	<a href="#">instantiateProcess</a> (String processId, Map variables) create an instance of the specified process with the added variable map and start the execution.
void	<a href="#">resumeTask</a> (String taskId) Resume the task if the task has SUSPENDED state.
void	<a href="#">setVariable</a> (String instanceId, String variableId, Object variableValue) Search for variable with id variableId into instance with id instanceId and set the given value to the found variable.
void	<a href="#">setVariable</a> (String instanceId, String activityId, String variableId, Object variableValue) Search for variable with id variableId into instance with id instanceId and within the activity with id activityId and set the given value to the found variable.
void	<a href="#">startTask</a> (String taskId) start the task.
void	<a href="#">suspendTask</a> (String taskId) Suspend the task if the task has EXECUTING state.

**Methods inherited from interface** [org.ow2.bonita.facade.RuntimeReadOnlyAPI](#)

```
getTaskList, getTaskList, getVariable, getVariable, getVariableDefinitions,  

getVariableDefinitions, getVariables, getVariables
```

## Methods

### **instantiateProcess**

```
public String instantiateProcess(String processId)  

throws ProcessNotFoundException
```

Create an instance of the specified process and start the execution. returned instance has STARTED state. If the first activity has StartMode=manual then a task has been created. If the first activity has StartMode=automatic then the automatic behavior of the activity has been started.

**Parameters:**

processId - the process id.

**Returns:**

the id of the created instance.

**Throws:**

[ProcessNotFoundException](#) - if the process has not been found.  
[BonitaInternalException](#) - if an exception occurs.

### **instantiateProcess**

```
public String instantiateProcess(String processId,  

Map variables)  

throws ProcessNotFoundException
```

create an instance of the specified process with the added variable map and start the execution. returned instance has STARTED state. If the first activity has StartMode=manual then a task has been created. If the first activity has StartMode=automatic then the automatic behavior of the activity has been started.

**Parameters:**

processId - the process id.

variables - variables added to the variables already set within the process definition.

**Returns:**

the id of the created instance.

**Throws:**

[ProcessNotFoundException](#) - if the process has not been found.  
[BonitaInternalException](#) - if an exception occurs.

### **startTask**

```
public void startTask(String taskId)  

throws TaskNotFoundException,  

IllegalTaskStateException
```

start the task. If successful, this operation changes task state from READY to EXECUTING.

**Parameters:**

taskId - the task id.

(continued from last page)

**Throws:**

- [TaskNotFoundException](#) - if the task has not been found.
- [IllegalTaskStateException](#) - if the state of the task has not READY state.
- [BonitaInternalException](#) - if an exception occurs.

---

## finishTask

```
public void finishTask(String taskId)
    throws TaskNotFoundException,
        IllegalTaskStateException
```

Finish the task. If successful, this operation changes task state from EXECUTING to FINISHED.

**Parameters:**

- taskId - the task id.

**Throws:**

- [TaskNotFoundException](#) - if the task has not been found.
- [IllegalTaskStateException](#) - if the state of the task has not EXECUTING state.
- [BonitaInternalException](#) - if an exception occurs.

---

## suspendTask

```
public void suspendTask(String taskId)
    throws TaskNotFoundException,
        IllegalTaskStateException,
        UnauthorizedUserException
```

Suspend the task if the task has EXECUTING state.  
If successful, this operation changes task state from EXECUTING to SUSPENDED.

**Parameters:**

- taskId - the task id.

**Throws:**

- [TaskNotFoundException](#) - if the task has not been found.
- [IllegalTaskStateException](#) - if the state of the task has not either READY or EXECUTING state.
- [BonitaInternalException](#) - if an exception occurs.

---

## resumeTask

```
public void resumeTask(String taskId)
    throws TaskNotFoundException,
        IllegalTaskStateException,
        UnauthorizedUserException
```

Resume the task if the task has SUSPENDED state. If successful, this operation changes task state from SUSPENDED to EXECUTING.

**Parameters:**

- taskId - the task id.

**Throws:**

- [TaskNotFoundException](#) - if the task has not been found.
- [IllegalTaskStateException](#) - if the state of the task has not SUSPENDED state.
- [UnauthorizedUserException](#) - if the user is not the user assigned to the task.
- [UnauthorizedUserException](#) - if task has not been assigned and the user is not in the list of candidates for the task.
- [BonitaInternalException](#) - if an exception occurs.

## setVariable

```
public void setvariable(String instanceId,
    String variableId,
    Object variableValue)
throws InstanceNotFoundException
```

Search for variable with id variableId into instance with id instanceId and set the given value to the found variable.

- If the XPDL dataField has String type then use instance of java.lang.String class for variableValue.
- If the XPDL dataField has EnumerationType type then use instance of org.ow2.bonita.runtime.var.Enumeration class for variableValue.

The field selectedValue can contain only one value from the possibleValues list field.

### Parameters:

instanceId - the instance id.  
variableId - the variable id.  
variableValue - the variable value.

### Throws:

[InstanceNotFoundException](#) - if the instance has not been found.  
[BonitaInternalException](#) - if an exception occurs.

---

## setVariable

```
public void setvariable(String instanceId,
    String activityId,
    String variableId,
    Object variableValue)
throws InstanceNotFoundException,
ActivityNotFoundException
```

Search for variable with id variableId into instance with id instanceId and within the activity with id activityId and set the given value to the found variable.

- If the XPDL dataField has String type then use instance of java.lang.String class for variableValue.
- If the XPDL dataField has EnumerationType type then use instance of org.ow2.bonita.runtime.var.Enumeration class for variableValue.

The field selectedValue can contain only one value from the possibleValues list field.

### Parameters:

instanceId - the instance id.  
activityId - the activity id.  
variableId - the variable id.  
variableValue - the variable value.

### Throws:

[InstanceNotFoundException](#) - if the instance has not been found.  
[ActivityNotFoundException](#) - if the activity has not been found.  
[BonitaInternalException](#) - if an exception occurs.

---

## deleteInstance

```
public void deleteInstance(String instanceId)
```

This method is only dedicated for bonita unit tests!

Delete existing tasks from the instance with id instanceId from the task repository. Then delete the instance with id instanceId from the instance repository. Recorded data are currently not removed from the history or/and the history.

(continued from last page)

**Parameters:**

instanceId - the instance id.

**Throws:**

BonitaInternalException - if an exception occurs.

---

## deleteAllInstances

```
public void deleteAllInstances(String processId)
```

This method is only dedicated for bonita unit tests!

Delete all instances created for the process with id processId from the instance repository. Recorded data are currently not removed from the history or/and the history.

**Parameters:**

processId - the process id.

**Throws:**

BonitaInternalException - if an exception occurs.

# org.ow2.bonita.facade Interface RuntimeReadOnlyAPI

All Subinterfaces:  
[RuntimeAPI](#)

All Known Implementing Classes:  
[RuntimeReadOnlyAPIImpl](#)

public interface **RuntimeReadOnlyAPI**

extends

Getters for tasks and variables. User's Todo and Work lists operations.

## Method Summary

Collection	<a href="#">getTaskList</a> (org.ow2.bonita.util.Constants.TaskState taskState) Obtain the user tasks with state either READY or EXECUTING or SUSPENDED for the given instance.
Collection	<a href="#">getTaskList</a> (String instanceId, org.ow2.bonita.util.Constants.TaskState taskState) Obtain the user tasks with state either READY or EXECUTING or SUSPENDED for the given instance.
Object	<a href="#">getVariable</a> (String instanceId, String variableId) Obtain a process variable for the given instance and variable .
Object	<a href="#">getVariable</a> (String instanceId, String activityId, String variableId) Obtain a variable for the given activity and instance.
Map	<a href="#">getVariableDefinitions</a> (String processId) Obtain the variable definitions of the process for the given process.
Map	<a href="#">getVariableDefinitions</a> (String processId, String activityId) Obtain variable definitions (including global process and local activity variables)for the given process and activity.
Map	<a href="#">getVariables</a> (String instanceId) Obtain the process variables for the given instance.
Map	<a href="#">getVariables</a> (String instanceId, String activityId) Obtain the activity variables (including global process and local activity variables) for the given instance and activity.

## Methods

### getTaskList

```
public Collection getTaskList(String instanceId,
                           org.ow2.bonita.util.Constants.TaskState taskState)
        throws InstanceNotFoundException
```

Obtain the user tasks with state either READY or EXECUTING or SUSPENDED for the given instance. if the state is READY the task could have been assigned or not. if the state is EXECUTING or SUSPENDED the task has been assigned.

(continued from last page)

**Parameters:**

instanceId - the instance id.  
taskState - the state of the task.

**Returns:**

a collection of task records. If no tasks are found, an empty collection is returned.

**Throws:**

[InstanceNotFoundException](#) - if no instance record is found with the given instance id.  
[BonitaInternalException](#) - if an other exception occurs.

## getTaskList

```
public Collection getTaskList(org.ow2.bonita.util.Constants.TaskState taskState)
```

Obtain the user tasks with state either READY or EXECUTING or SUSPENDED for the given instance. if the state is READY the task could have been assigned or not. if the state is EXECUTING or SUSPENDED the task has been assigned.

**Parameters:**

taskState - the state of the task.

**Returns:**

a collection of task records. If no tasks are found, an empty collection is returned.

**Throws:**

[BonitaInternalException](#) - if an other exception occurs.

## getVariable

```
public Object getVariable(String instanceId,  

    String activityId,  

    String variableId)  

throws InstanceNotFoundException,  

ActivityNotFoundException,  

VariableNotFoundException
```

Obtain a variable for the given activity and instance. This variable could be local to the activity or global to the process.

**Parameters:**

instanceId - the instance id.  
activityId - the activity id.  
variableId - the variable id.

**Returns:**

the variable object.

**Throws:**

[InstanceNotFoundException](#) - if no instance record is found with the given instance id.  
[ActivityNotFoundException](#) - if no activity record is found with the given activity id.  
[VariableNotFoundException](#) - if no variable is found with the given id.  
[BonitaInternalException](#) - if an other exception occurs.

## getVariables

```
public Map getVariables(String instanceId,  

    String activityId)  

throws ActivityNotFoundException
```

Obtain the activity variables (including global process and local activity variables) for the given instance and activity.

(continued from last page)

**Parameters:**

`instanceId` - the instance id.  
`activityId` - the activity id.

**Returns:**

the map of activity variables where key is the variable id and value is the variable object.

**Throws:**

[ActivityNotFoundException](#) - if no activity record is found with the given activity id.  
[BonitaInternalException](#) - if an other exception occurs.

## getVariable

```
public Object getVariable(String instanceId,
                        String variableId)
                throws InstanceNotFoundException,
                       VariableNotFoundException
```

Obtain a process variable for the given instance and variable .

**Parameters:**

`instanceId` - the instance id.  
`variableId` - the variable id.

**Returns:**

the variable object.

**Throws:**

[InstanceNotFoundException](#) - if no instance record is found with the given instance id.  
[VariableNotFoundException](#) - if no variable is found with the given id.  
[BonitaInternalException](#) - if an other exception occurs.

## getVariables

```
public Map getVariables(String instanceId)
                     throws InstanceNotFoundException
```

Obtain the process variables for the given instance.

**Parameters:**

`instanceId` - the instance id.

**Returns:**

the map of process variables where key is the variable id and value is the variable object.

**Throws:**

[InstanceNotFoundException](#) - if no instance record is found with the given instance id.  
[BonitaInternalException](#) - if an other exception occurs.

## getVariableDefinitions

```
public Map getVariableDefinitions(String processId,
                                String activityId)
                throws ProcessNotFoundException,
                       ActivityNotFoundException
```

Obtain variable definitions (including global process and local activity variables)for the given process and activity.

**Parameters:**

(continued from last page)

`processId` - the process Id.  
`activityId` - the activity id.

**Returns:**

the map of variable definitions where key is the variable id and value is the variable object.

**Throws:**

[ProcessNotFoundException](#) - if no process record is found with the given process id.

[ActivityNotFoundException](#) - if no activity record is found with the given activity id.

[BonitaInternalException](#) - if an other exception occurs.

---

## getVariableDefinitions

```
public Map getVariableDefinitions(String processId)  
throws ProcessNotFoundException
```

Obtain the variable definitions of the process for the given process.

**Parameters:**

`processId` - the process Id.

**Returns:**

the map of variable definitions where key is the variable id and value is the variable object.

**Throws:**

[ProcessNotFoundException](#) - if no process record is found with the given process id.

[BonitaInternalException](#) - if an other exception occurs.

---

## org.ow2.bonita.facade.exception Class BonitaInternalException

```

java.lang.Object
  +-java.lang.Throwable
    +-java.lang.Exception
      +-java.lang.RuntimeException
        +-org.ow2.bonita.util.BonitaRuntimeException
          +-org.ow2.bonita.facade.exception.BonitaInternalException

```

**All Implemented Interfaces:**  
java.io.Serializable

---

public class **BonitaInternalException**  
extends org.ow2.bonita.util.BonitaRuntimeException

Thrown if an internal Bonita error occurred. Please contact Bonita Team at Bull SAS.

### Constructor Summary

public	<a href="#">BonitaInternalException</a> (String message, Throwable cause)
public	<a href="#">BonitaInternalException</a> (String message)

Constructs a BonitaInternalException with the specified detail message and the throwable cause.

Constructs a BonitaInternalException with the specified detail message.

### Method Summary

static <a href="#">BonitaInternalException</a> on	<a href="#">build</a> (RuntimeException exception)
---	--

### Constructors

#### BonitaInternalException

```
public BonitaInternalException(String message,  
                           Throwable cause)
```

Constructs a BonitaInternalException with the specified detail message and the throwable cause.

**Parameters:**

message - msg the detail message.  
cause - exception causing the abort.

#### BonitaInternalException

```
public BonitaInternalException(String message)
```

(continued from last page)

Constructs a BonitaInternalException with the specified detail message.

**Parameters:**

message - the detail message.

## Methods

### build

```
public static BonitaInternalException build(RuntimeException exception)
```

## org.ow2.bonita.facade.exception Class DeploymentException

```
java.lang.Object
  +-java.lang.Throwable
    +-java.lang.Exception
      +-org.ow2.bonita.util.BonitaException
        +-org.ow2.bonita.facade.exception.DeploymentException
```

All Implemented Interfaces:  
java.io.Serializable

**public class DeploymentException**  
extends org.ow2.bonita.util.BonitaException

Exception indicating a failure during the deployment operation.

### Field Summary

private final	<a href="#">className</a>
private final	<a href="#">packageId</a>

### Constructor Summary

public	<a href="#">DeploymentException</a> (String msg) Constructs an DeploymentException with the specified detail message.
public	<a href="#">DeploymentException</a> (String msg, Throwable cause) Constructs a DeploymentException with the specified detail message and the throwable cause.
public	<a href="#">DeploymentException</a> (String msg, String className) Constructs a DeploymentException with the specified detail message and className parameter.
public	<a href="#">DeploymentException</a> (String msg, String className, String packageId) Constructs a DeploymentException with the specified detail message and className, packageId parameters.

### Method Summary

String	<a href="#">getclassName()</a>
String	<a href="#">getpackageId()</a>

### Fields

(continued from last page)

## className

```
private final java.lang.String className
```

---

## packageId

```
private final java.lang.String packageId
```

## Constructors

### DeploymentException

```
public DeploymentException(String msg)
```

Constructs an DeploymentException with the specified detail message. ClassName and packageId are set to null.

**Parameters:**

msg - the detail message.

---

### DeploymentException

```
public DeploymentException(String msg,  
                           Throwable cause)
```

Constructs a DeploymentException with the specified detail message and the throwable cause. ClassName and packageId are set to null.

**Parameters:**

msg - the detail message.

cause - exception causing the abort.

---

### DeploymentException

```
public DeploymentException(String msg,  
                           String className)
```

Constructs a DeploymentException with the specified detail message and className parameter. PackageId is set to null.

**Parameters:**

msg - the detail message.

className - the name of the class to deploy.

---

### DeploymentException

```
public DeploymentException(String msg,  
                           String className,  
                           String packageId)
```

Constructs a DeploymentException with the specified detail message and className, packageId parameters.

**Parameters:**

msg - the detail message.

className - the name of the class to deploy.

packageId - the id of the package.

## Methods

### **getclassName**

```
public String getclassName()
```

---

### **getpackageId**

```
public String getpackageId()
```

## org.ow2.bonita.facade.exception Class IllegalTaskStateException

```

java.lang.Object
  +-java.lang.Throwable
    +-java.lang.Exception
      +-org.ow2.bonita.util.BonitaException
        +-org.ow2.bonita.facade.exception.IllegalTaskStateException

```

All Implemented Interfaces:  
 java.io.Serializable

public class **IllegalTaskStateException**  
 extends org.ow2.bonita.util.BonitaException

This exception is thrown when the current state differs from the expected states.

### Field Summary

private final	<a href="#">currentState</a>
private final	<a href="#">expectedStates</a>
private final	<a href="#">taskId</a>

### Constructor Summary

public	<a href="#">IllegalTaskStateException</a> (String msg, String taskId, Set expectedStates, org.ow2.bonita.util.Constants.TaskState currentState) Constructs an IllegalTaskStateTException.
--------	--

### Method Summary

org.ow2.bonita.util.C onstants.TaskState	<a href="#">getCurrentState()</a>
Set	<a href="#">getExpectedStates()</a>
String	<a href="#">getTaskId()</a>

### Fields

#### taskId

private final java.lang.String **taskId**

## expectedStates

```
private final java.util.Set expectedstates
```

---

## currentState

```
private final org.ow2.bonita.util.Constants.TaskState currentState
```

## Constructors

### IllegalTaskStateException

```
public IllegalTaskStateException(String msg,  
                           String taskId,  
                           Set expectedStates,  
                           org.ow2.bonita.util.Constants.TaskState currentState)
```

Constructs an IllegalTaskStateTException.

#### Parameters:

- msg - the detail message.
- taskId - the task Id.
- expectedStates - the expected states.
- currentState - the current state.

## Methods

### getTaskId

```
public String getTaskId()
```

---

### getExpectedStates

```
public Set getExpectedStates()
```

---

### getCurrentState

```
public org.ow2.bonita.util.Constants.TaskState getCurrentState()
```

## org.ow2.bonita.facade.exception Class InstanceNotFoundException

extends org.ow2.bonita.util.BonitaException
```

### Field Summary

private final	<a href="#">taskId</a>
---------------	------------------------

### Constructor Summary

public	<a href="#">TaskNotFoundException(String taskId)</a>
--------	--

### Method Summary

String	<a href="#">getTaskId()</a>
--------	-----------------------------

## Fields

### taskId

private final java.lang.String **taskId**

## Constructors

### TaskNotFoundException

public [TaskNotFoundException\(String taskId\)](#)

## Methods

(continued from last page)

## getTaskId

```
public String getTaskId()
```

## org.ow2.bonita.facade.exception Class UnAuthorizedUserException

```
java.lang.Object
  +-java.lang.Throwable
    +-java.lang.Exception
      +-org.ow2.bonita.util.BonitaException
        +-org.ow2.bonita.facade.exception.UnAuthorizedUserException
```

All Implemented Interfaces:  
java.io.Serializable

public class **UnAuthorizedUserException**  
extends org.ow2.bonita.util.BonitaException

This exception is thrown when a user attempts to execute an unauthorized action.

### Field Summary

private final	<a href="#">instanceId</a>
private final	<a href="#">taskId</a>
private final	<a href="#">userId</a>

### Constructor Summary

public	<a href="#">UnAuthorizedUserException</a> (String msg, String instanceId, String userId) Constructs an UnAuthorizedUserException for instance.
public	<a href="#">UnAuthorizedUserException</a> (String msg, String instanceId, String taskId, String userId) Constructs an UnAuthorizedUserException for task.

### Method Summary

String	<a href="#">getInstanceId()</a>
String	<a href="#">getTaskId()</a>
String	<a href="#">getUserID()</a>

### Fields

#### instanceId

private final java.lang.String **instanceId**

(continued from last page)

---

## taskId

```
private final java.lang.String taskId
```

---

## userId

```
private final java.lang.String userId
```

## Constructors

### UnAuthorizedUserException

```
public UnAuthorizedUserException(String msg,  
                                 String instanceId,  
                                 String userId)
```

Constructs an UnAuthorizedUserException for instance. TaskId is set to null.

**Parameters:**

- msg - the detail message.
- instanceId - the instance id.
- userId - the user id.

---

### UnAuthorizedUserException

```
public UnAuthorizedUserException(String msg,  
                                 String instanceId,  
                                 String taskId,  
                                 String userId)
```

Constructs an UnAuthorizedUserException for task.

**Parameters:**

- msg - the detail message.
- instanceId - the instance id.
- taskId - the task id.
- userId - the user id.

## Methods

### getTaskId

```
public String getTaskId()
```

---

### getInstanceId

```
public String getInstanceId()
```

---

## getuserId

```
public String getuserId()
```

## org.ow2.bonita.facade.exception Class VariableNotFoundException

```
java.lang.Object

## Constructors

### **RuntimeAPIImpl**

```
public RuntimeAPIImpl()
```

## Methods

### **instantiateProcess**

```
public String instantiateProcess(String processId)
throws ProcessNotFoundException
```

Create an instance of the specified process and return the instanceId

### **instantiateProcess**

```
public String instantiateProcess(String processId,
Map variables)
throws ProcessNotFoundException
```

### **deleteInstance**

```
public void deleteInstance(String instanceId)
```

### **deleteAllInstances**

```
public void deleteAllInstances(String processId)
```

## startTask

```
public void startTask(String taskId)
    throws TaskNotFoundException,
        IllegalTaskStateException
```

---

## finishTask

```
public void finishTask(String taskId)
    throws TaskNotFoundException,
        IllegalTaskStateException
```

---

## suspendTask

```
public void suspendTask(String taskId)
    throws TaskNotFoundException,
        IllegalTaskStateException,
        UnAuthorizedUserException
```

---

## resumeTask

```
public void resumeTask(String taskId)
    throws TaskNotFoundException,
        IllegalTaskStateException,
        UnAuthorizedUserException
```

---

## setVariable

```
public void setVariable(String instanceId,
    String variableId,
    Object variableValue)
throws InstanceNotFoundException
```

---

## setVariable

```
public void setVariable(String instanceId,
    String activityId,
    String variableId,
    Object variableValue)
throws InstanceNotFoundException,
    ActivityNotFoundException
```
