Security service

The security service is used in collaboration with a JAAS Login module that we ask application servers to use (most of them now support JAAS Realms).

The security service is then filled with JAAS Subject objects when the JAAS Login module methods are called.

The security service then acts as an authorisation server between all the services which is convenient for internal SSO between services (as this is the case for our new JCR service that uses the security service to re-authenticate the user).
