

Plugin PluginXlsXml

Jérémie Defaye

The plugin of Xls-Xml transformation makes possible to inject into SaloméTMF tool the requirements and/or tests stored in a worksheet. In the same way, the requirements and the tests can be extracted from saloméTMF.

The goal of this plugin is to store in a single worksheet the requirements and the tests of these requirements during the writing of detailed functional specifications and detailed technical specifications. When the worksheet contains all this information, the pluginXlsXml injects all these data in SaloméTMF. Constantly, it is possible to extract the progress report of the cover of the requirements and/or the tests into a worksheet.

The generated or exported data relate to the test plan and the requirements (if the plugin is present).

Access to functionalities of the plugin of documents generation documents is made via the button “Tools”, present in the first three windows of Salome: “Tests Management”, “Campaign Management” and “Data Management”.

- The “Plugin Excel” menu proposes via three sub-menus either to export project's data in a XLS spreadsheet document, or to import data in a project from a XLS document, or to generate an empty model of XLS document.

This plugin is strongly depend on the plugins “requirements” and “DocXML”.
