

Using Apache HTTP Server Version 2.0 with Enhydra

Table of Contents

1. Configuration.....

Chapter 1. Configuration

Apache HTTP Server Version 2.0 can be configured to redirect http requests to Enhydra multiserver. To obtain such functionality, edit the Apache configuration file:

- Uncomment the following lines:

```
LoadModule proxy_module modules/mod_proxy.so
LoadModule proxy_connect_module modules/mod_proxy_connect.so
LoadModule proxy_http_module modules/mod_proxy_http.so
```

- Add the following lines (adjusting the access privileges to suit your configuration):

```
<IfModule mod_proxy.c>
```

```
<Proxy *>
```

```
    Order deny,allow
```

```
#    Deny from all
```

```
    Allow from all
```

```
</Proxy>
```

- Define the prefixes for enhydra applications, for example:

```
ProxyPass /poker http://localhost:9006
```

```
ProxyPassReverse /poker http://localhost:9006
```

```
</IfModule>
```

- Connect to the url corresponding to the prefix, for example:

```
http://localhost/poker
```
