Load any portal context from the admin portal context

One of the great eXo platform feature is the ability to load another owner portal from a current portal context.

That is especially usefull when for example an admin user wants to modify some pages of another user and does not know his password. By using the Portal Admin portlet, the admin can simply load the other user portal, modify it and come back to its own portal.

You can access the portlet from the admin home page as shown in the next screenshot:

The portlet will print the list of all the users of the portal. You can use the search form to look for a user. Regular expressions such as benj* are supported. The you can click on the edit link.

Portal Admin ↓ ↑			
Owner	Edit Permission	View Permission	action
admin	owner	owner	edit
demo	owner	owner	edit
exo	any	any	edit
portal	any	any	edit
<div style="text-align: right;"> <<Prev 1 Next>> (Displaying 1 - 4 of 4 items) </div> <div> <div>Owner <input type="text"/></div> <div>View Permission <input type="text" value="All"/></div> <div>Edit Permission <input type="text" value="All"/></div> <div> search</div> </div>			

That will load the user context as if you were logged in using that user password. The only difference you will see is the "Restore previous context" link that will allow you to come back to your admin portal.

try it, adopt it...

A New Portal World...

The **eXo platform™** software is a powerful Open Source corporate portal and content management system. Users of the platform have a customized single point of access to the company's information system and resources. The use of a corporate portal increases productivity as it provides business information to the firm's employees, allows the exchange and management of this data, as well as the execution of critical business processes, from the web environment.

Based on industry standards and leading the innovation in its field, the **eXo platform™** is a low cost solution that offers a very high Return On Investment. Moreover, the source code for the whole platform is distributed allowing each client to adapt the portal to specific business requirements and to react aptly to technological developments.
