Tutorial: Create Your First Portlet Using eXo Platform Eclipse Plugin

Part 2: Downloading and installing eXo Platform Eclipse Plugin

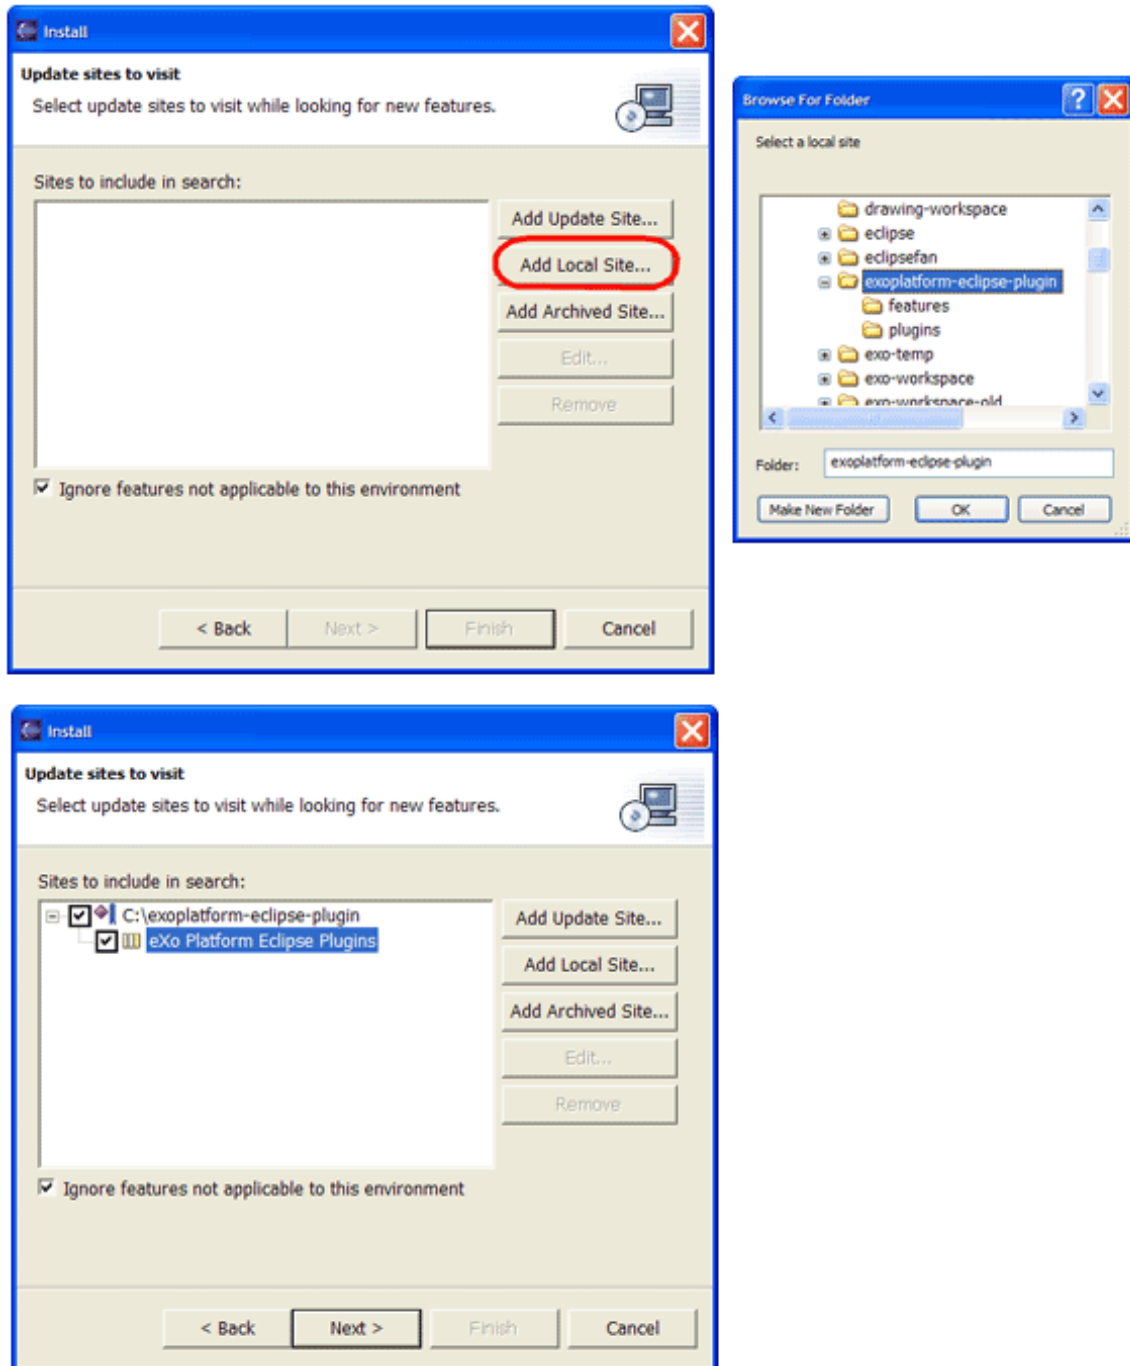

- Get eXo Platform Eclipse Plugin from sourceforge.net [download page](#). The download page contains all available releases. Select the latest one.
- Unzip the plugin release file to a directory of your choice. Important Note: avoid using eclipse installation directory or any of its subdirectories. This is because you will be installing via the update manager. Tell the update manager where you unzipped the release files, and it will copy them to the appropriate eclipse directories for you.

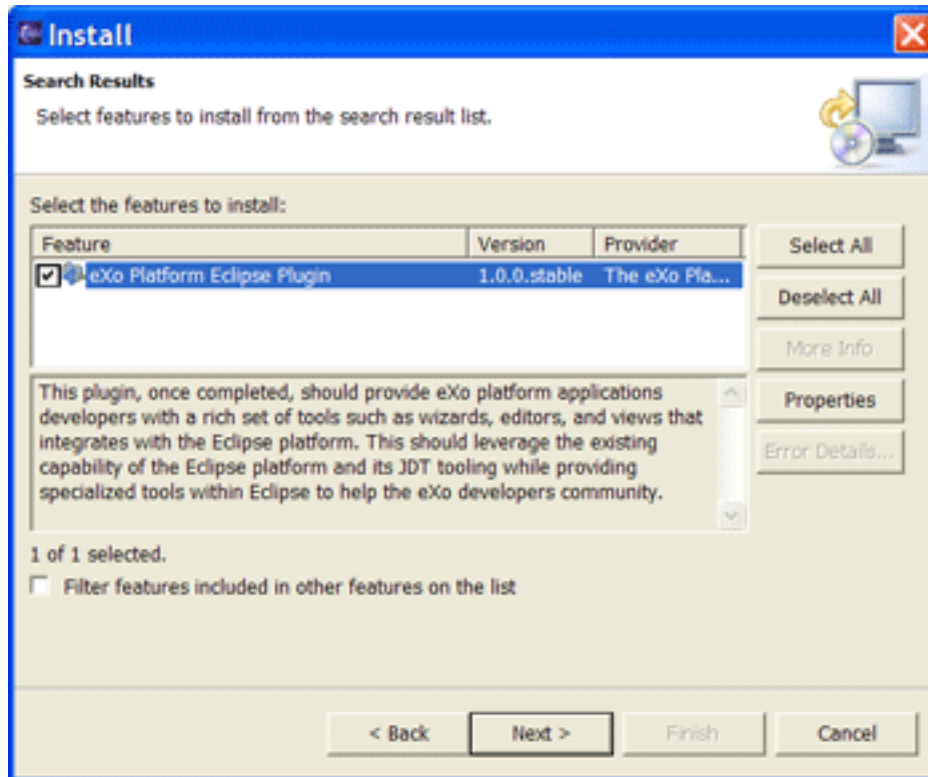

- In the Install/Update dialog, select Search for new features to install.

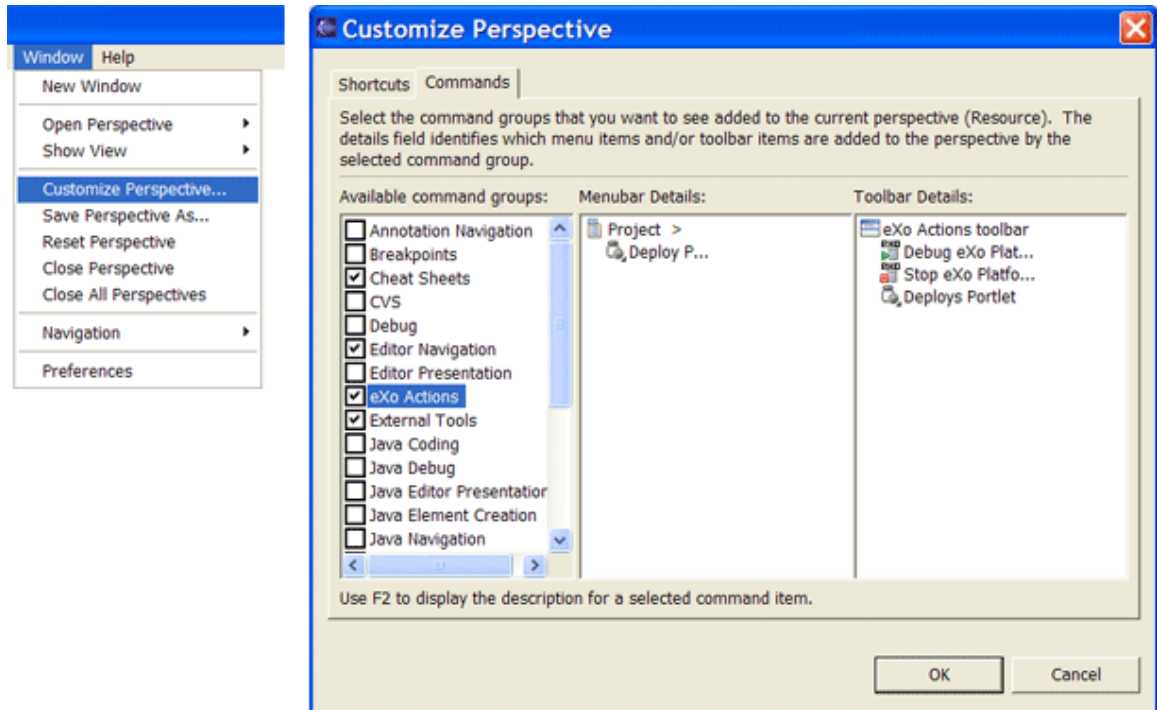

- In the Install dialog, click on Add Local Site... and select the folder that you unzipped the release files into. The Install dialog will now show the eXo Platform Eclipse Plugins as a site to search. Select this site and click on the Next > button.

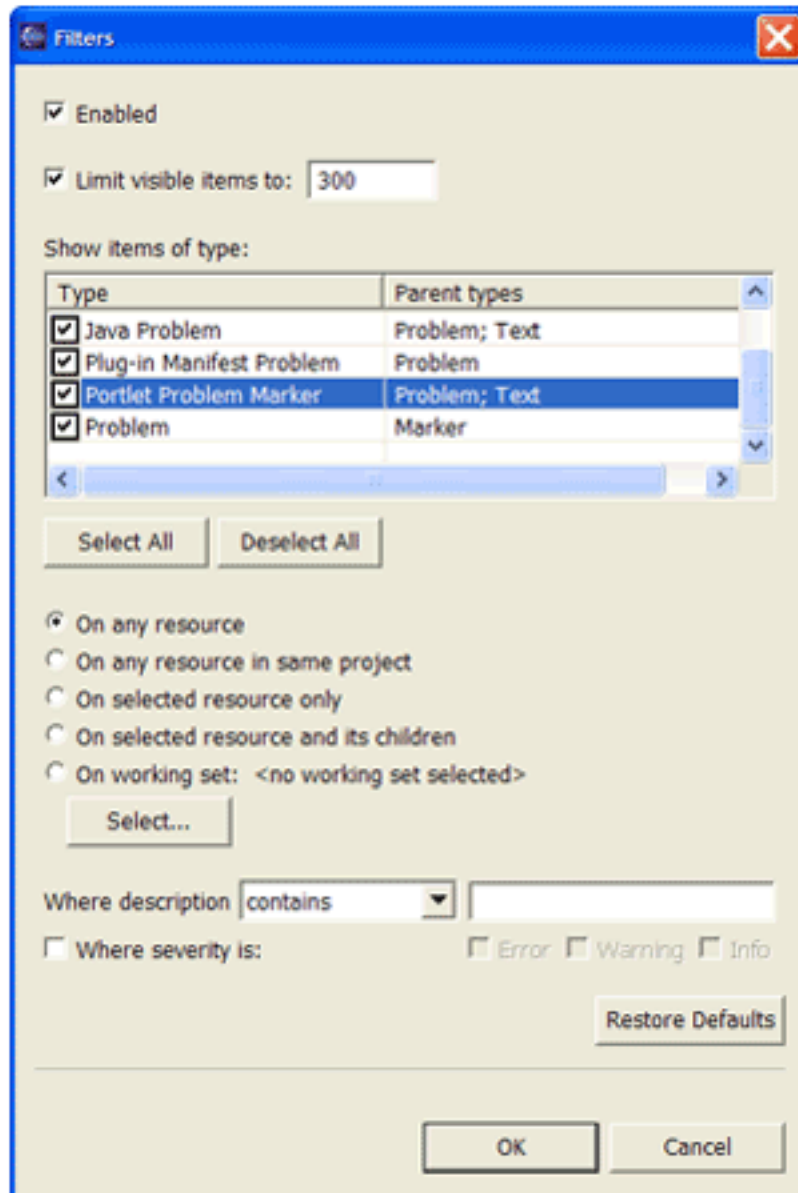

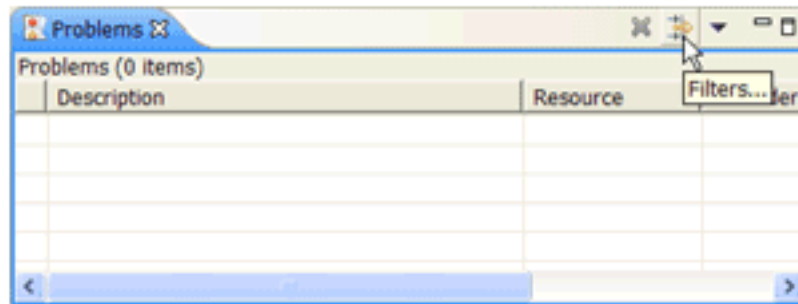

- The Install dialog will now show you the search result for the available features in the site. Select the eXo Platform Eclipse Plugin feature, and click on the Next > button.

- Follow the instructions as given by the Install wizard. Please notice that since the eXo platform plugin is not digitally signed, you will get a warning dialog during installation. At the end of the installation you will be asked to restart Eclipse.
- After restarting Eclipse, if you do not see the new toolbar buttons then select Window > Customize Perspective... this opens the Customize Perspective dialog. Select the Commands tab, and select the eXo Actions item.

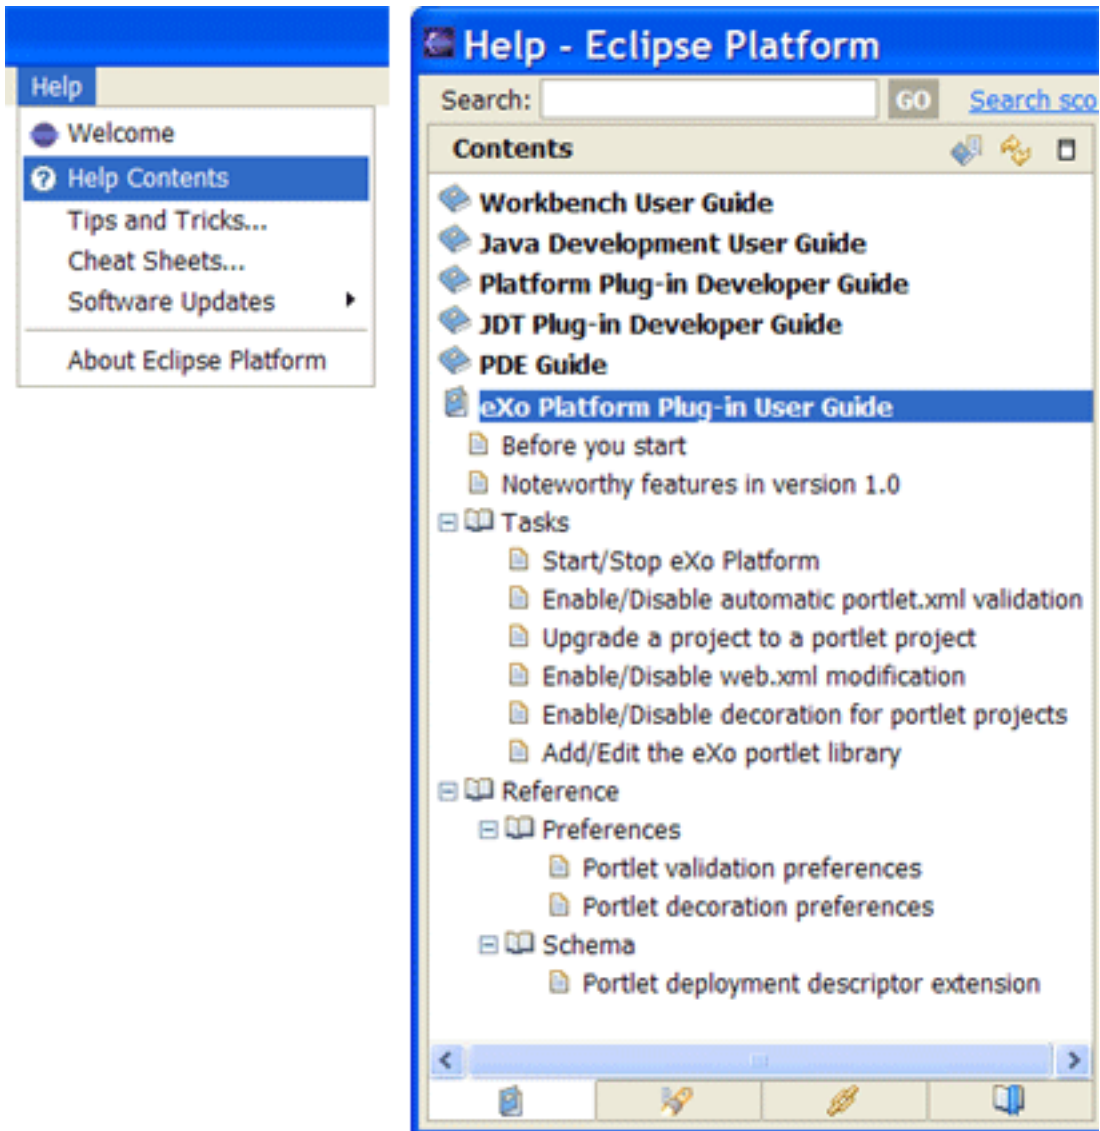

- Verify that the Problems view is set to display any portlet validation errors by clicking on the Filters... button, and selecting the 'Portlet Problem Marker' item.

- Great you are done with Part 2, it is time for [Part 3](#).

- Tip: To view the User Guide that comes with the plugin, select Help > Help Contents and then select eXo Platform Plug-in User Guide book.
