

[Main.setupeclipse](#)

Set up elcipse

- [import src from CVS](#)
- [Set up project](#)
- [Set up plugin](#)

NOTE: The eclipse do not support multiproject very well. So far, I cannot figure out how to configure eclipse for exo multiproject with cvs. You need to create 2 workspaces, one workspace to check out the the exo code as a single project, and one workspace to import multiproject.

my directory structure is

```
eclipse/cvsworkspace exoworkspace java/exoplatform (the place that i  
check out the code in cvs worksapce) maven
```
