

# Processors: Pipeline

```
<company>
  <emp>...</emp>
  <emp>...</emp>
  <emp>...</emp>
</company>
```

1: Input document is referenced with the *href* attributes

```
<for-each href="company.xml" select="/company/emp"
  root="new-company" id="company-out">
```

2: The different parts are determined based on the *select* XPath expression

3: The processors inside the `<for-each>` are executed on each part

4: The documents produced by each execution are aggregated in the root element (*root* attribute)

5: The aggregated document is accessible with the *id* declared in the *id* attribute
