Version/Release n°:	0.6	Data Version/Release:	December, 14th 2005
Update description:	First release - Draft		

Document goal

The document aim is to introduce the reader to the SpagoBI concepts by means of a full example based on the “SpagoBI demo distribution” . The demo is freely downloading from the ObjectWeb forge (http://forge.objectweb.org/project/showfiles.php?group_id=204)

The document includes the following main chapters :

- **Conceptual overview.** Introduction of the core concepts of the SpagoBI free open source platform.
- **Getting started with SpagoBI.** How to build step-by-step an analytic application by means of the case study available in the SpagoBI demo distribution. Starting from the development of a report template using the iReport tools, you are introduced to the document parametrization and configuration following a logical path. Issues regarding Portal e System configuration are intentionally placed at the end of the chapter, as they involve more complex topics. The chapter uses a static simple report example to explain the SpagoBI main concepts.
- **In more depth.** How to build an analytical portal in more detail.

References

For further information about SpagoBI platform refer to the following documentation, available on the project site (<http://spagobi.eng.it>):

Help for lecture

Follows a short description of the most common views in SpagoBI.

1.1 STYLISTIC CONVENTIONS

LITTLE CAPITALS	The LITTLE CAPITALS references to the icon in a mask.
<i>italics</i>	The <i>italics</i> refers to fields of the masks.
<ITALIC CAPITALS>	In <ITALIC CAPITALS> the logical variables are suitable.
boldface	In boldface the main concepts.

1.2 SPECIAL SECTIONS

Note

Example

Reference to other section

In revision phase

Future implementation. To be done.

Advice for the reading of the section

2 SpagoBI - Conceptual overview

SpagoBI is a platform for the development of Business Intelligence projects: SpagoBI offers all the tools and the necessary components for the realization of analytical portals, whose designing and setting are the main project activities.

The development of an analytical portal with SpagoBI doesn't require the implementation of some J2EE services; you have only to set up the analytical documents and to register them correctly in the platform.

The **analytical documents** provide the end user with the needed information, in the most suitable way. SpagoBI allows to use many categories of analytical tools: Report, OLAP, Data Mining, Dashboard, Visual Inquiry.

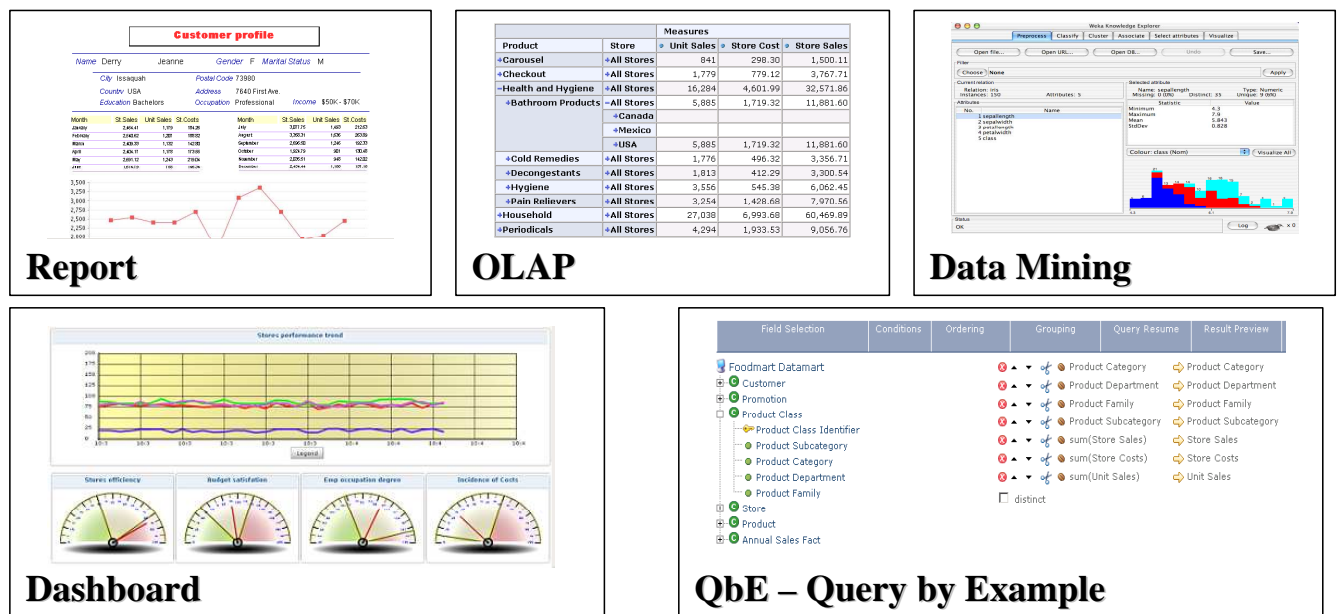

Fig. 1 – Analytical documents

The Business Intelligence analyst and designer have to find the most suitable tool for every type of analysis and category of user. In fact, the building of an **analytical portal** is a balanced composition of different tools in order to give to each users' category the right degree of visibility and at the same time a freedom of movement through the information of his pertinence.

SpagoBI realizes both the structural and the executive support to the single analytical areas.

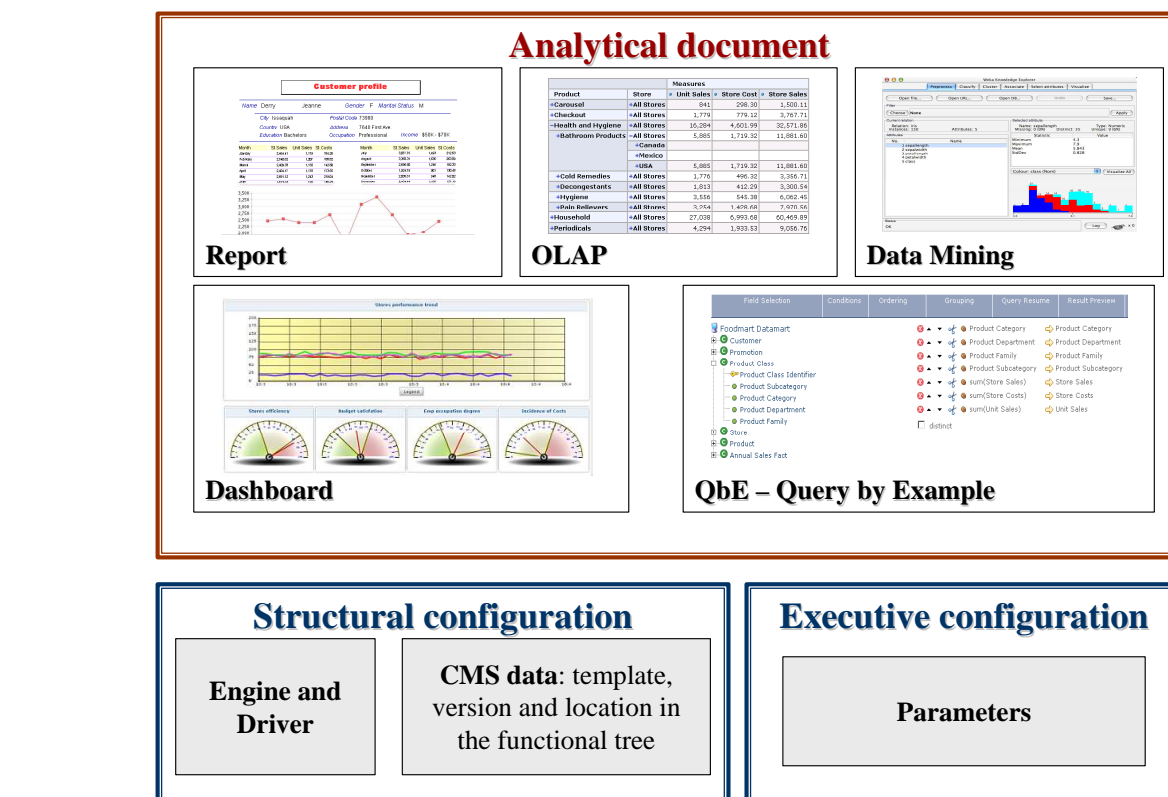

Fig. 2 – Analytical documents support

Regarding to the **structural configuration**, every analytical documents' category refers to a particular (one or many) execution engine, interacting with SpagoBI through a specific driver. For every analytical document SpagoBI keeps the history of the templating version and organize them in the functional tree.

The SpagoBI demo has got a preloaded metadata environment allowing to manage:

- report on the JasperReport engine;
- OLAP on the Mondrian engine, with Jpivot interface;
- Dashboard on the OpenLazslo engine;
- free inquiry on a Hibernate implementation.

The Dashboard implementation by means of OpenLaszlo compiler is under a phase of greater integration through.

Data Mining integration is a planned activity.

Many other alternative engines in every analytical area will be integrated in the SpagoBI platform in the future.

Regarding to the **executive configuration**, SpagoBI manages some parameters as autonomous and independent entities. The parameters include the behaviour rules

(presentation and validation) according to the end-user roles. Through the parameters, SpagoBI builds an executive environment which places in the middle the operative model referred to the particular reality in use.

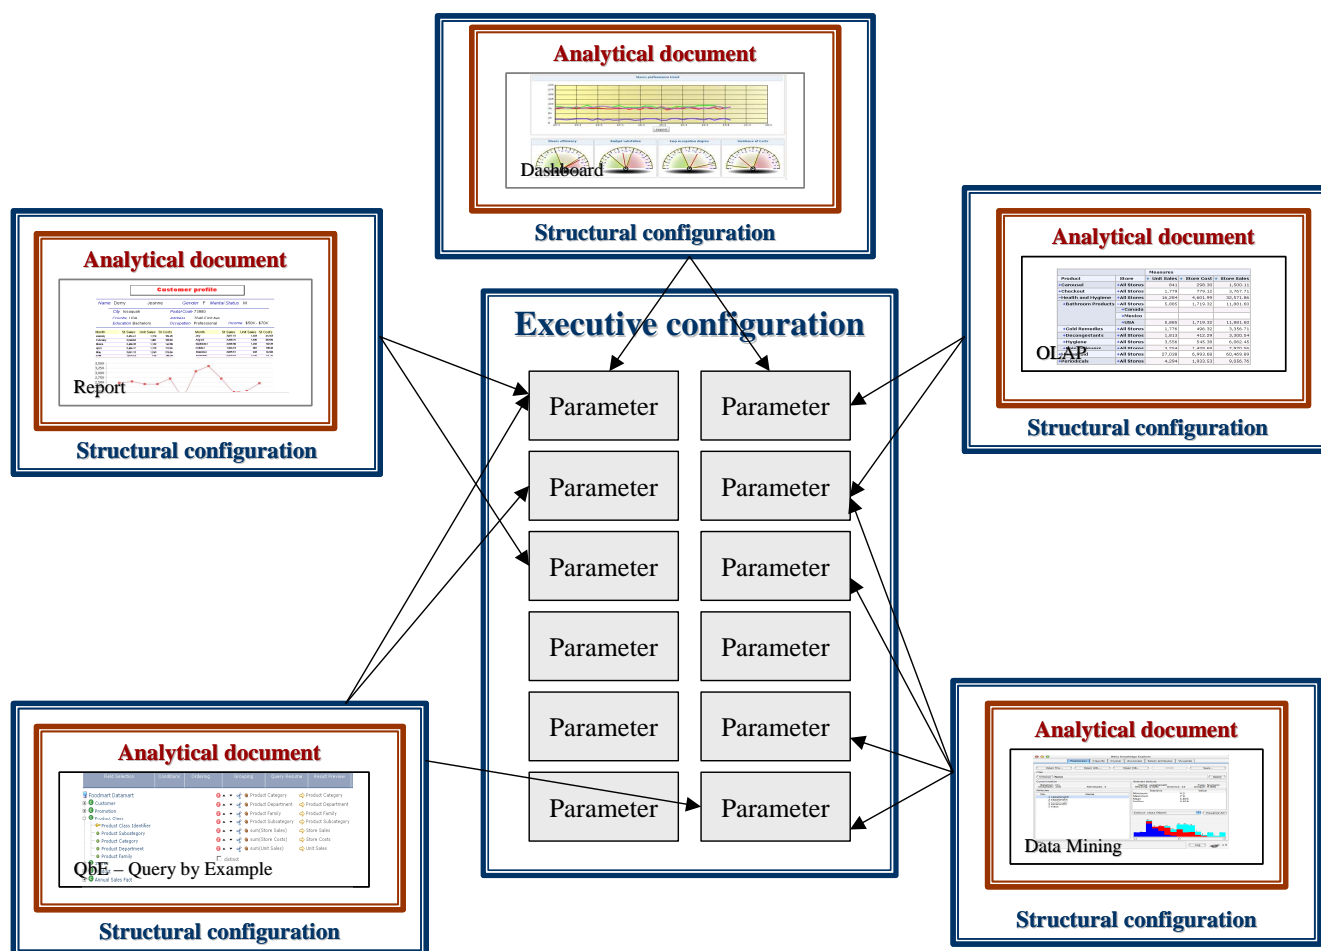

Fig. 3 – Executive configuration

A **parameter** models a concept or a datum frequently used as discriminant on the global data context.

Every parameter can be used in many different ways, according to the different end-users' roles. So, every use mode refers to an initial visualization method, to one or more validation rules and to one or more end-user roles.

Follow a parameter abstract schema and an implementation example.

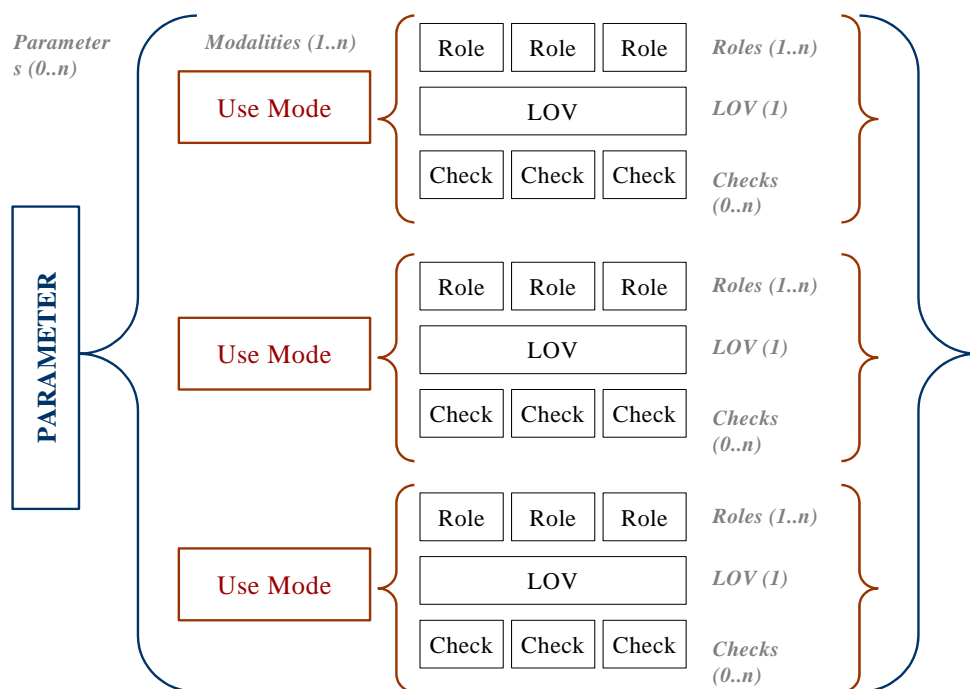

Fig. 4 – Parameter's abstract structure

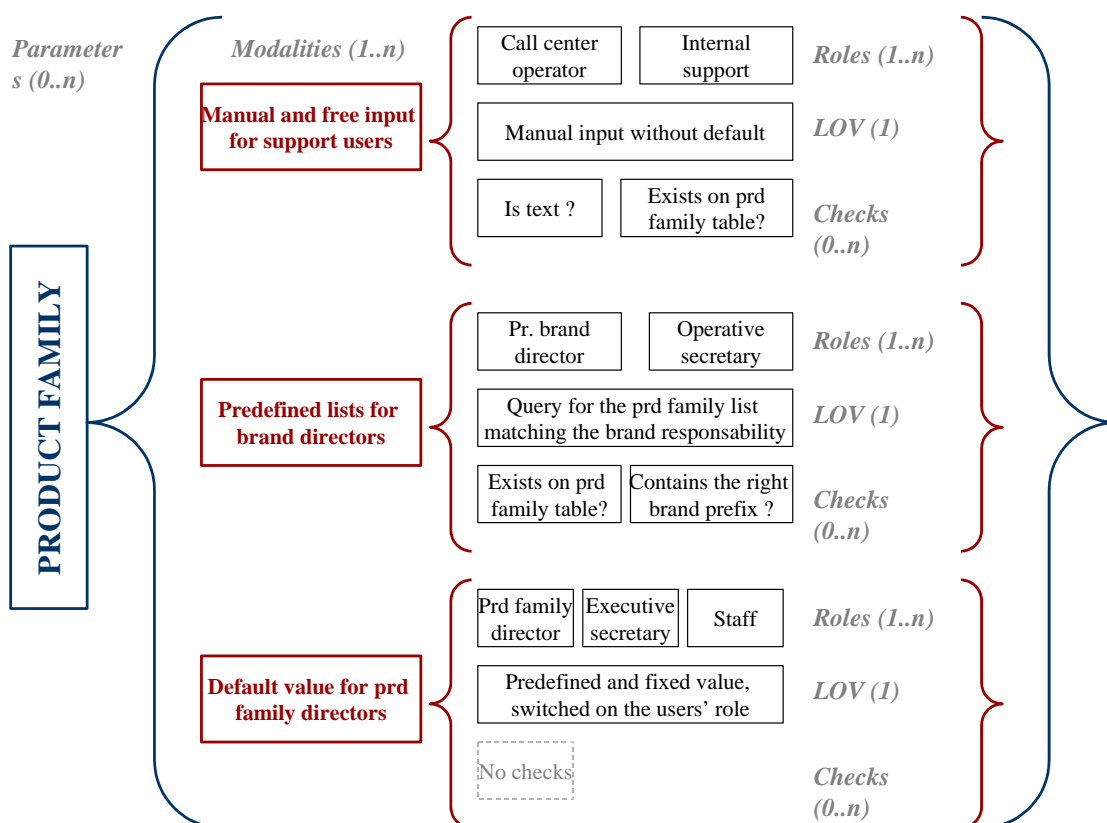

Fig. 5 – Parameter's implementation example

Every parameter can be associated to many different analytical documents (also for category) driving their behaviour according to its rules.

The recording phase of an analytical document must therefore set its structural (driver, engine, CMS) and executive (parameters) information.

When a user (with its role) runs an analytical document, the structural information are read and then a custom page for the parametric input is produced on the basis of the execution information. At the end the document is produced on the basis of the inserted values (explicitly or implicitly).

A sample follows in the picture below:

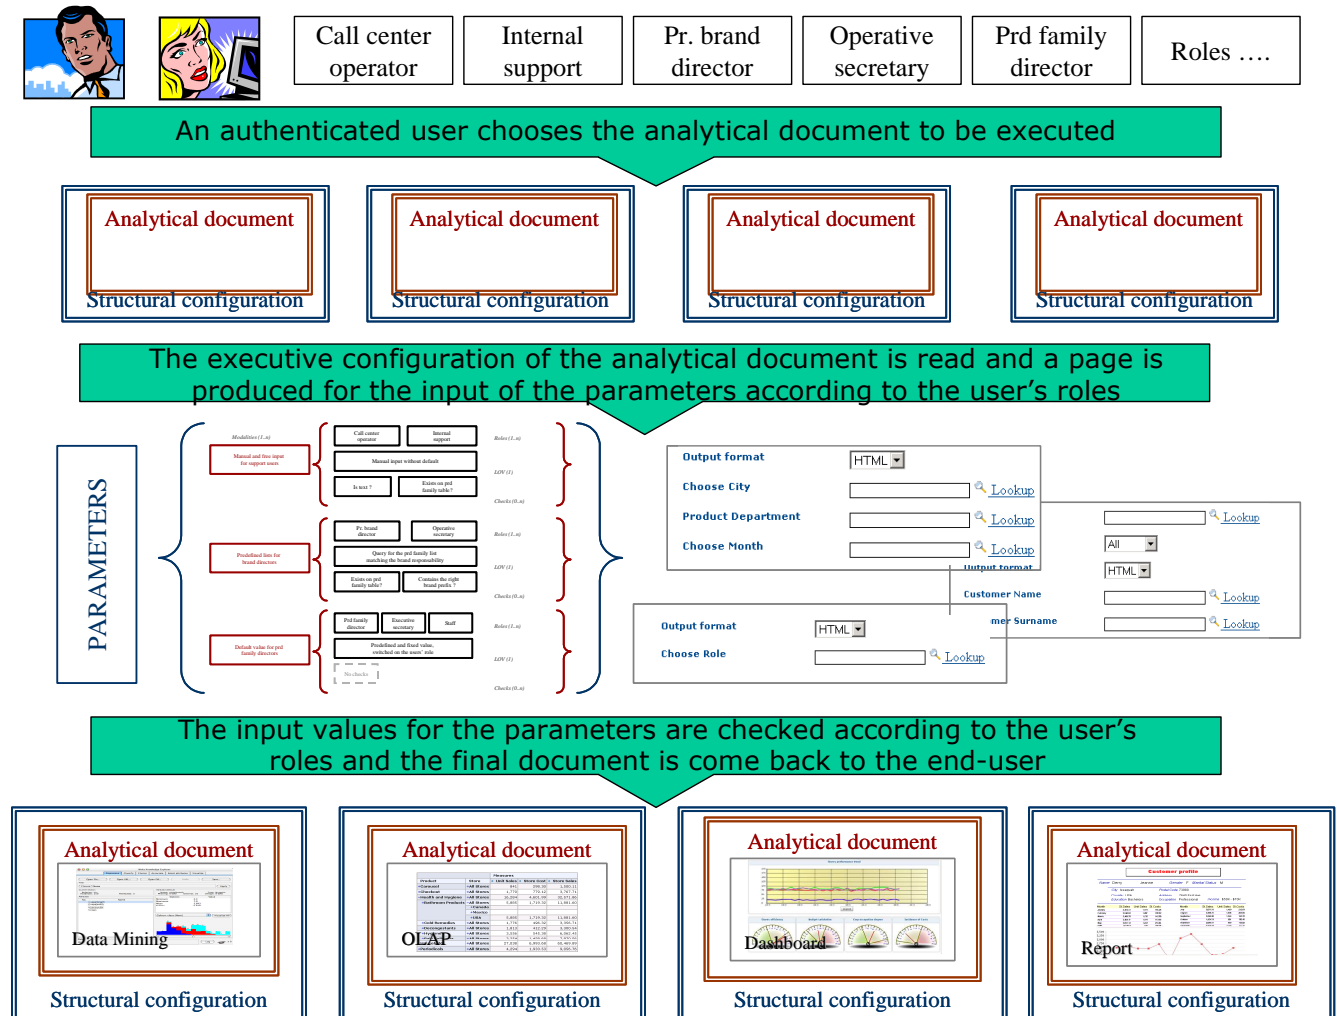

Fig. 6 – Analytical document execution

A new analytical document requires a process handling as the one shown in the following schema:

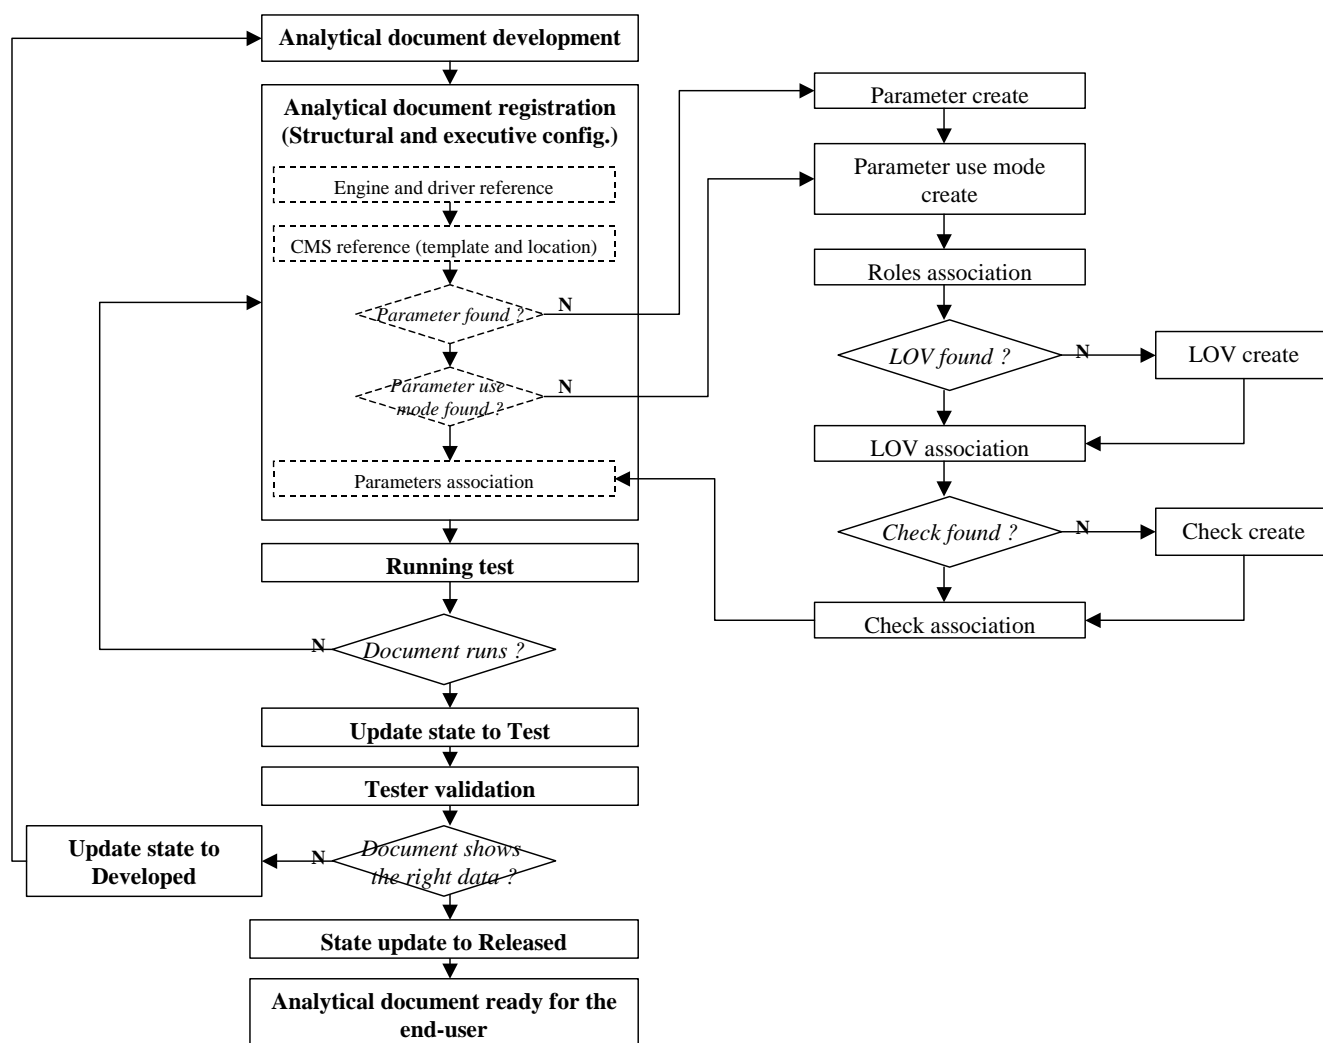

Fig. 7 – Analytical document handling

The schema points out also the management of the approval flow for the analytical document passing from the developer to the tester, reaching the end user when certified only.

Please see in the next paragraphs how SpagoBI allows to run all these operations.

3 Recurring themes

Both the development and the administration interface are under revision to achieve a better usability.

3.1 PORTLET LAYOUT

Every user portlet points out some common characteristics:

- On the top, there is the title identifying the portlet meaning.
- On the right side of the title, some icons allow the access to the general functions acting on the portlet's content. The main functions are (where admitted):
 -  going back to the previous page without saving changes; Every portlet
 -  creating a new element; Every portlet
 -  switching from the list view to the tree view; Document config.
 -  switching from the tree view to the list view; Document config.
 -  saving information without going back to the previous Details pages
 -  saving information and going back to the previous pag;. Details pages
 -  testing before saving. LOV details
- The '*' character identifies the required fields.

3.2 LIST AND DETAILED VIEW

One of the most common views in SpagoBI is a simple table showing a list of elements.

Common characteristics are:

- On the top, the title identifying the table meaning.
- The first row shows a label for each column displayed.
- The list can be divided into pages that can be turn over using the two arrows on the bottom row.
- The current page and the total number of pages are displayed in the middle of the bottom row.
- Every list has a detailed page showing and allowing to modify all the data about a single element.

Every list is alphabetically ordered on the first column's content (the label) and each row shows the essential data of an element, always identified by a unique label or title.

On the right side of every row, some icons drive the operativeness on the single element (row) of the list. The main possible functions are (where admitted):

-  accessing the details page for the selected element (row). Every list
-  deleting the corresponding element (row); Every list

-  executing the corresponding element (row);
 -  accessing the use modes page for the corresponding element (row);
 -  Selecting all.
- Analytical Doc. list only
Parameter list only
Tree management

A standard view of a list and detailed page follows.

Query Definition: select distinct city, state_province as province, country from customer order by city

Fig. 8 – List-details Example

4 Functionality overview

4.1 ADMINISTRATOR

If you do not have familiarity with SpagoBI yet, we suggest you to skip all this section (chapter 4.1) using the standard demo settings.

The administrator (biadmin/biadmin user) main tasks are:

- Registering and configuring each analytical engine used inside the platform;
- Configuring the functional structure that classifies the analytical documents and distributes the rights required in order to use it and to access it;
- Maintaining the registered analytical documents.

Notice that the administrator manages the **structural configuration** of the platform

These functions are provided by means of a single portlet that can be included into a portal environment supporting its specification.

Fig. 9 – Administrator portlet

4.1.1 ENGINES CONFIGURATION

Engines are external applications or internal SpagoBI classes delegated to display the final results of an analytical document. There are different engines to deal with different analytical areas (Report, OLAP, Data Mining and Dashboard). More than one engine could be available for the same area.

The SpagoBI administrator has to mark the attributes that are necessary for the correct use of an engine. By means of a correct configuration the user can both use the same instances of the same engine inside different environments (development, test, production), in order not to invalidate its performances, and to use different and parallel engines inside the same environments.

For the correct use of the engines it is very important to set the proper **driver**: this is a SpagoBI component delegated to configure the analytical document properly communicating to a specific engine. Therefore, they can be seen as an Adapter set between the analytical document and the specific engine.

A list of all the registered engines can be displayed accessing the *Engine Configuration*.

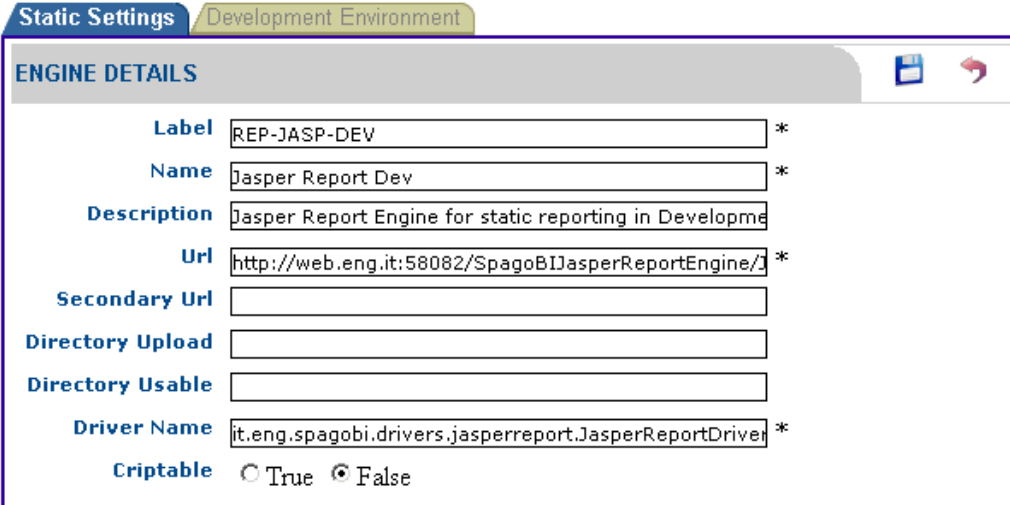

Static Settings		Development Environment
ENGINES LIST		
LABEL	NAME	DESCRIPTION
OLAP-BO-DEV	Business Objects DEV	Business Objects Engine for Development Environment
OLAP-CST-ORA-DEV	Custom Oracle Engine DEV	Custom engine for Oracle rdbms in Development Environment
OLAP-JP-MD-DEV	Jpivot-Mondrian Dev	Jpivot-Mondrian Olap Engine in Development Environment
OLAP-JP-MD-REL	Jpivot-Mondrian Rel	Jpivot-Mondrian Olap Engine in Release Environment
REP-BIRT-DEV	Birt Report Engine DEV	Eclipse Birt Report Engine in Development Context

REP-JASP-REL	Jasper Report Rel	Jasper Report Engine for static reporting in Release Environment
page 1 of 1		

Fig. 10 – Engines list

Each engine is depicted by a unique label, a name and a brief description. The user can create a new engine, erase an existing one or access their details page in order to change their configuration.

The information required for each engine are:

- **Label:** engine unique identifier;
- **Name:** engine name;
- **Description:** brief engine description (optional);
- **URL:** location where the engine can be accessed by the server;
- **Secondary URL:** location where the engine can be found if it is not available at the primary URL;
- **Directory Upload:** server directory where the templates are uploaded;
- **Directory Usable:** engine directory where the templates can be found;
- **Driver Name:** class that creates an URL compliant with the specific engine.
- **Criptable:** if set to true the request will be encrypted.

Static Settings / **Development Environment**

ENGINE DETAILS

Label REP-JASP-DEV *

Criptable ☐ True ☒ False

Fig. 11 – Engine details

The current SpagoBI version uses the following drivers:

- *JasperReport*: report analysis;
- *Jpivot*: OLAP analysis;

4.1.2 FUNCTIONALITIES MANAGEMENT

SpagoBI uses its own file system, named "**Functionality Tree**", that allows to better organize documents by grouping them by folder regulating the access to them.

This multi-level hierarchical structure (Fig. 12) can be created and modified exclusively by the administrator in the "Function Administration" area.

Notice that it is only possible to add a new folder to the root element, called *Functionalities (Areas)*, but not to modify it.

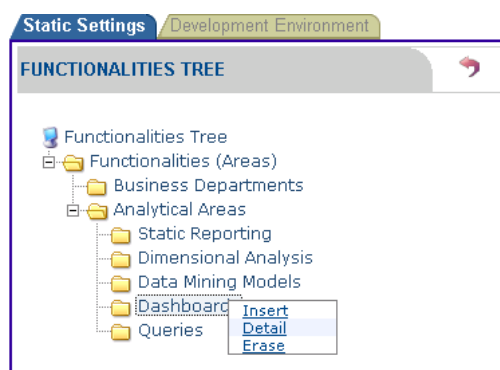

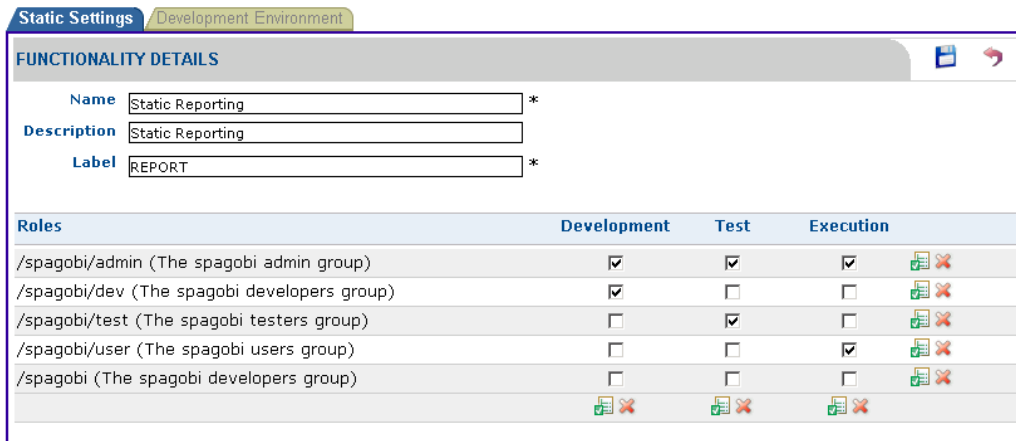

Fig. 12 – Functionalities Tree

A list of possible actions can be visualized by clicking on a node of the *Functionalities Tree*.

The administrator can **Delete** an existing functionality, if this doesn't contain any sub-nodes. Moreover, he can create a new functionality. By choosing the **Insert** option, he can access a new page where he can fill in all required information. This new element will be child of the selected one. Detailed information regarding an existing functionality can be displayed and modified by selecting the **Detail** option.

Static Settings **Development Environment**

FUNCTIONALITY DETAILS

Name: Static Reporting *

Description: Static Reporting

Label: REPORT *

Roles	Development	Test	Execution
/spagobi/admin (The spagobi admin group)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
/spagobi/dev (The spagobi developers group)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
/spagobi/test (The spagobi testers group)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
/spagobi/user (The spagobi users group)	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
/spagobi (The spagobi developers group)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Fig. 13 – Functionality details

Each folder is characterized by a name, a unique code and a optional brief description. The list of the *Roles* allows the administrator to choose, for the selected functionality, whether to assign or remove the permissions required for the development, test or execution phase of each role.

For instance, checking the Development and the Test boxes of the "SpagoBI user group", all the users logged as "biuser" will only be able to develop and test documents belonging to the selected functionality, but not to execute them.

Notice that every new node inherits (by default) all its father's rights.

4.1.3 DOCUMENT CONFIGURATION

A list of all the *Analytical Documents* registered in SpagoBI can be listed accessing to the *Document Configuration* by the administrator. This area allows the administrator to manage the extraordinary maintenance of the documents.

Notice that the administrator is also a user and therefore he can execute all the released documents belonging to a folder on which he has the *Execution* permission.

Fig. 14 – Administration Objects List

Each document is described by a subset of its attributes, as follows:

- **Label:** the document unique identifier;
- **Name:** the document name;
- **Description:** a brief description of the document (optional);
- **Type:** this field shows if the document is a Report, an On-line analytical processing (OLAP), a Data Mining model, a Dashboard, etc.;
- **State:** this information indicates if the document must be developed (*Development*), tested (*Test*) or can be executed (*Released*). Moreover the document can also be *Suspended* if it cannot be executed anymore.

The administrator has the *List View* but he can switch to the *Functionality Tree* in order to have a list of documents grouped by functionality, selecting the corresponding icon at the bottom of the window.

Fig. 15 – Administration Object Details

The complete list of information can be seen in the *Document Details* page:

- **Engine:** the name of a registered engine that has to be used to execute the *Analytical Document*;
- **Criptable:** if set to true the request will be encrypted;
- **Template:** a file containing the model of the document to be created with an external application suitable for the specific type of the *Analytical Document*. On the right hand side of the page, in the "Template Version" table, all templates that have been selected for this document since it has been created are listed. For each template, this list specifies the version identifier, the date when this selection occurred first and the name of the file. Through this view, the user will always be able to erase, download or select one of the listed templates.

To be completed.

4.2 DEVELOPER

The developer's role is quite complex. This section explains its functionalities. In the chapter 5 you can find an example showing how the single functionalities work together for the right environment settings.

The developer (bidev/bidev user) main tasks are:

- to define the possible presentation and the preloading way (LOV – list of values) for the parameters;
- to define the validation rules (CHECK) for the input value;
- to create the parameters (PARAMETER) and to set up their behaviour rules associating LOV and CHECK to the user's roles;
- to register and to configure each analytical document, referring to the used parameters.

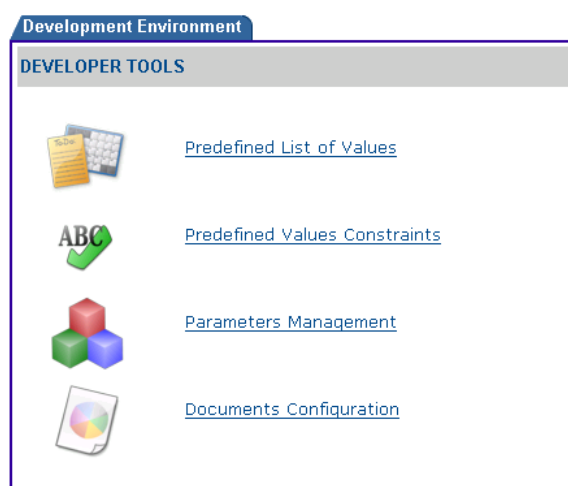

Fig. 16 – Developer tools

Notice that the developer manages the **executive configuration** of the platform and only a few **structural configuration**.

Notice that at the start-up you have to create many LOV, CHECK and PARAMETER, but when the system runs regularly, you have to associate just the parameters already created to the new documents. You have to create new ones only for exceptions.

4.2.1 PREDEFINED LIST OF VALUE (LOV)

From the *Developer Tools* view it is possible to access the list of the *Predefined List of Value* (LOV). It is described by some identifying data (label, name and description) and by its Input Type.

Development Environment			
PREDEFINED LIST OF VALUES			
LABEL	NAME	DESCRIPTION	INPUT TYPE
CITY_QY_01	City by Query	City List of Values Managed by Query	QUERY
CITY_QY_02	City in Canada	City in Canada by query statement	QUERY
COUNTRY_FX_01	Country Canada	Country by fixed value	FIX_LOV
COUNTRY_QY_01	Country by Query	Country List of Values Managed by Query	QUERY
CST_NAME_QY	Customer Name	Customer Name by Query	QUERY
CST_SURNAME_QY	Customer Surname	Customer Surname by Query	QUERY
DEPA_QY_01	Department by Query	Department Description Managed by Query	QUERY
EMPPOS_QY_01	Employment Position by Query	Employment Position Title Managed by Query	QUERY
FOODMART_JNDI_DS	Foodmart Jndi Ds	Foodmart Jndi DataSource	SCRIPT
GENDER_FX_01	Gender by Fixed Value	Gender values by predefined list	FIX_LOV
page 1 of 4			

Fig. 17 – Predefined List of Values

Accessing the details page, general information are displayed:

- **Label:** LOV unique identifiers;
- **Name:** LOV name;
- **Description:** brief description of the LOV (optional);
- **Input Type:** four different types of LOV are admitted allowing:
 - **Manual Input:** the free parameters allocation;
 - **Query:** the database retrieval of all the selected values;
 - **Fixed LOV:** the organization of an arbitrary value list;
 - **Script:** the registration of methods and classes delegated to the recovering of all the values to suggest.

Development Environment

PREDEFINED LIST OF VALUES DETAILS

Label: CITY_QY_01 *

Name: City by Query *

Description: City List of Values Managed by Query

Input Type: Query statement

Wizard Query

Connection Name: dwh *

Visible Columns: city, province, country *

Value Column: city *

Query Definition: select distinct city, state_province as province, country from customer order by city

Figure 18 - Predefined List of Values Details

According to the selected typology, in the bottom of the page a wizard is available in order to ease its specific composition.

In the *Query Statement* case (the picture example above) the required information are:

- o **Connection Name:** logic identifier of the database source;
- o **Visible Columns:** name of the columns of the dataset that will be displayed;
- o **Value Column:** name of the unique column of the dataset containing values that will be return as a result of the parameter;
- o **Query Definition:** the SQL statement.

In the *Fixed Values* case, you can create a table of pairs (Name,Value) simply by filling the *New item name* and the *New item value* fields and clicking on the Add icon. In order to erase an existing pair you can use the icon on the corresponding row of the list at the bottom of the window.

New item name: * 

New item value: *

Name	Value	
All		
Female	F	
Male	M	

Figure 19 – Fixed values wizard

In the *Script* case you have to write the Groovy script to be executed at run time.

Script

```
StringBuffer buf = new StringBuffer();
buf.append('<rows>');
buf.append('<row value=''');
Random rand = new Random();
float f = 15 + ((rand.nextFloat() * 100) % 10);
buf.append(f);
buf.append('</row>');
buf.append('</rows>');
return buf;
```

Output

☒ Single Value

☐ List of Values

Figure 20 – Script widget

4.2.2 PREDEFINED VALUES CONSTRAINTS

The developer can register some typologies of formal controls applying to the values inserted in the documents activations phase.

Development Environment			
CONFIGURABLE CONSTRAINTS			
LABEL	NAME	DESCRIPTION	CHECK TYPE
CK-CUS-01	American Date	The format of american Date	DATE
CK-CUS-02	Italian Date	Define the format of the italy date	DATE
CK-CUS-03	MaxLenght20	MaxLenght20	MAXLENGTH
CK-CUS-04	MaxLenght30	Length 30 characters	MAXLENGTH
CK-CUS-05	Range 10-20	Value between 10-20	RANGE
CK-CUS-06	2 decimal places	2 decimal places	DECIMALS
page 1 of 1			
PREDEFINED CONSTRAINTS			
LABEL	NAME	DESCRIPTION	CHECK TYPE
CK-FIX-01	Internet Address	Control if parameter is an Internet Address	INTERNET ADDRESS
CK-FIX-02	Numeric	Control if a parameter is Numeric	NUMERIC
CK-FIX-03	Alfanumeric	Control if a parameter is Alfanumeric	ALFANUMERIC
CK-FIX-04	Letter String	Control if a parameter is a letter string	LETTERSTRING
CK-FIX-05	Mandatory	Control if the parameter is present	MANDATORY
CK-FIX-06	Fiscal Code	Control if parameter is a Fiscal Code	FISCALCODE
CK-FIX-07	E-Mail	Control if parameter is a E-Mail	EMAIL
page 1 of 1			

Figure 21 - Predefined Constraints and Configurable Constraints

At the bottom of the displayed page there is a list of *Predefined Constraints* that cannot be modified. In the top of the page it is possible to create a set of *Configurable constraints*, simply clicking on the INSERT icon and entering the *Constraint Details* page.

The developer can add new configurable controls, erase the existing ones or access their detailed information in order to modify them.

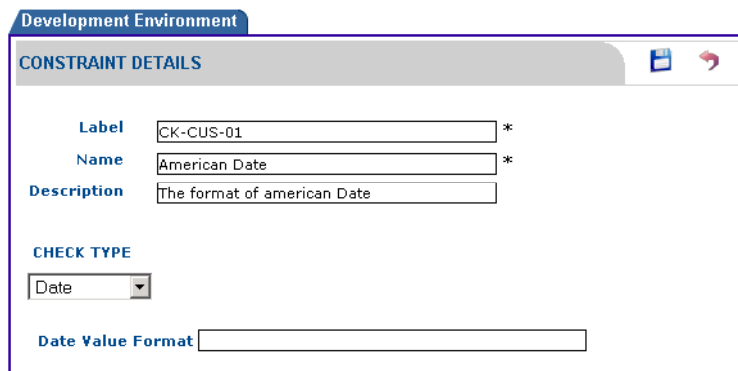

Figure 22 - Constraints Details

Every constraint is identified by a unique label, a name and a brief and optional description. In addition to some identification data (label, name and description) it is possible to configure some different control typologies:

- **date**: date format control;
- **regexp**: control through regular expressions;
- **min length**: minimum number of characters for the inserted values;
- **range**: to control a value included into two limits;
- **decimal**: decimal digits control;
- **max length**: maximum number of characters for the inserted values.

The developer can select a *Check Type* from the list by clicking on the corresponding radio button and filling in the required values. Each constraint can have just one *Check Type*.

4.2.3 PARAMETERS MANAGEMENT

SpagoBI handles the parameters in term of autonomous entities, each one with its own behaviour based on users' roles. So it is possible to associate to them different presentation (LOV) and validation (CHECK) rules.

The list view allows the developer to add new parameters, to erase the existing ones or to access their detailed information in order to modify them.

PARAMETERS LIST					
LABEL	NAME	DESCRIPTION	TYPE	N. USE MODES	
CITY_CD	City Code	Parameter for City Code Selection	STRING	1	  
COUNTRY_CD	Country Code	Parameter for Country Code selection	STRING	2	  
DEPAR_DESC	Department Description	Parameter for Department Description Selection	STRING	1	  
EMPPOS_CD	Employment Position Code	Parameter for Employment Position selection	STRING	1	  
GENDER_CD	Gender Code	Parameter for Gender Code selection	STRING	1	  
HIB_DIALECT	Hibernate Dialect	Hibernate Dialect	STRING	1	  
JNDI_DS	Jndi Datasource	Jndi Datasource	STRING	1	  
OUT_HTML	Output HTML	Output HTML	STRING	1	  
OUT_TP	Output Type	Parameter fo Output Type selection	STRING	4

OUT_PDF_TYPE	pdf output	pdf output	1
page 1 of 1			

Figure 25 – Parameter use modes list

As described before, each parameter can manage different user roles simply by assigning a specific way to collect data and specific constraints to validate the final input. This means that each role must be assigned to a specific *Use Mode*.

Each Use Mode requires the following information:

- **Label:** *Use Mode* unique identifiers;
- **Name:** *Use Mode* name;
- **Description:** brief description of the *Use Mode*;
- **Roles Association:** list of the roles associated to this *Use Mode*. A role cannot be associated to more than one *Use Mode*; anyway a role would not be associated to any Parameter *Use Mode*. In the second case a user having just that role will not be able to use a document related to this Parameter. The total number of roles associated to each *Use Mode* is also shown in the *Parameters Use Modes* list.
- **Predefined List of Value:** it is possible to select just one way to collect data from the list of available LOVs. To create a new *List of Values* please refer to the Predefined List of Value paragraph;
- **Predefined Values Constraints:** it is possible to assign zero, one or more constraints selecting them from the list of available constraints. To create a new *Predefined Values Constraints* please refer to the Predefined Values Constraints paragraph;

4.2.4 DOCUMENT CONFIGURATION

The user, simply by clicking on *Document Configuration* from the *Developer Tools* page, can display the *Development Object List*. This page catalogues all the *Analytical Documents* with a *Development* state or with a *Released* state. They have to be contained in a folder for which the user has a role authorized respectively for *Development* and for *Execution*.

Please notice that every new document will have the Development state. For a better comprehension, please refer to the Analytical Document life-cycle section.

Each document is described by a unique label, a name, a description and a type (report, OLAP, etc.).

DEVELOPMENT OBJECTS LIST							
LABEL	NAME	DESCRIPTION	TYPE	STATE			
TOP-PROD	Best Products	Best Products in Month	REPORT	DEV			
TOP-STORES	Best Stores	Best Stores in Month	REPORT	DEV			
RPT-CUST-PRF-01	Customer Profile 01	Report about Customer details	REPORT	DEV			
RPT-EMP-ST-01	Employee by store	Store details about employee	REPORT	DEV			
FOODMART_DATAMART	Foodmart Datamart	Foodmart Datamart	DATAMART	DEV			
DM_FOODMART_1	Foodmart to Inquiry	Foodmart to Inquiry	DATAMART	DEV			
OLAP-PROD-03	Product analysis 03	Online analysis about product sales	OLAP	DEV			
RPT_SALES_CITY_FX	Product subcategory sales	Product subcategory sales	REPORT	DEV			
RPT-PROD-PRF-01	Products PROFILE	Product details	REPORT	DEV			
SALES-X-CITY	Sales by city 01	Product sales for city	REPORT	DEV			

page 1 of 2

Figure 27 – Analytical documents list

The *Documents Details* page displays a complete list of attributes:

- **Label:** document unique identifier;
- **Name:** document name;
- **Description:** brief description of the document (optional);
- **Type:** document type (report, OLAP, Data mining model, Dashboard, etc.);
- **Engine:** engine that will be used to execute the document. The available engines are registered by the administrator (see Engines Configuration paragraph);
- **State:** the initial state of the document is always *Development*;
- **Template:** file containing the model of the document. It has to be created with an external application suitable for the specific type of Analytical Document.

When the developer inserts a new document he has to indicate the **Parent folder** under which the document will be created: this can be set by selecting the corresponding check box on the *Functionality Tree* displayed on the right hand side of the window.

Development Environment	
DOCUMENT DETAILS	
Label	<input type="text"/> *

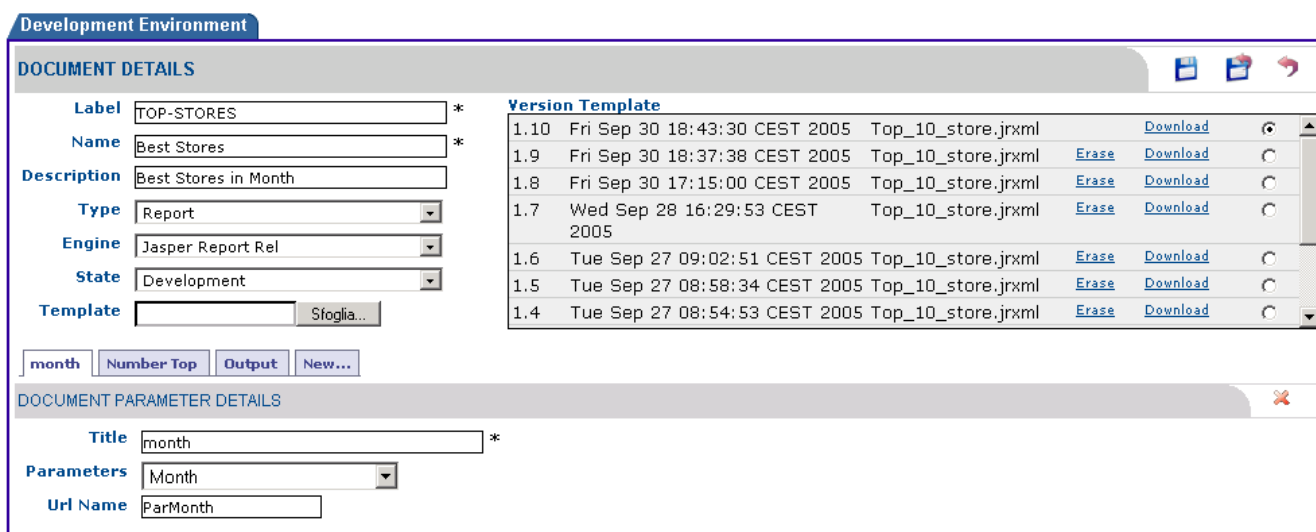

Figure 28 – Analytical document details (new document)

Multiple selection is allowed but at the moment is not implemented.

When the developer sees an existing document and selects the DETAILS icon, additional elements will be displayed:

- **Detailed information** (Top-left side): already explained data; they are the same view of the document creation phase;
- **Version template list** (Top-right side): every time the developer uploads a new template it will be set as the current default and will be added to this list specifying the version identifier, the date when this selection occurred first and the file name. By means of this view the user will always be able to erase, download or select one of the listed templates;
- **Parameters tabs** (bottom side): there is one tab for each parameter associated at the Analytical document. An additional tab (*New ...*) creating a new association is provided.

DOCUMENT PARAMETER DETAILS

Title: month *

Parameters: Month

Url Name: ParMonth

Figure 29 – Analytical document details (existing document)

In every parameter tab (for *Document Parameter Details*) the user is required to fill in the following information:

- **Title**: Document Parameter name;
- **Parameter**: combo box where all the available parameters are listed;
- **URL Name**: parameter name on the URL request. This must match the corresponding parameter belonging to the template.

Notice that during this phase it is not necessary to specify anymore about users' roles because they are completely managed through the visibility rules of the functional tree-view and through the behavioural parameters' description.

To be completed.

4.3 TESTER

The tester (bitest/bitest user) main tasks are:

- validating the produced Analytical Document to simulate all its predefined roles;
- updating the Document state to release the documents that becomes available for the end-user.

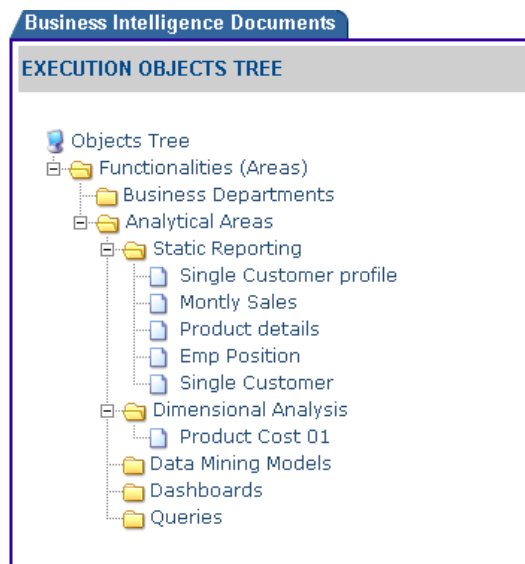

Figure 30 – Tester's documents tree

This type of user must verify the formal correctness of the registered documents and check if the documents in a test state works correctly and if they fulfil the requirements.

By means of the functional tree-view, this page lists all documents having *Test* or *Released* as current state. They belong to a folder for which the user has at least one role with a required permission respectively for Test and Execution.

For a better understanding of the Security Policy please refer to the Document organization and to the Security Policy paragraph.

The Tester can only execute a specific document by selecting it from the *Functionalities Tree*. If the selected document is in a *Test* state with a parameter associated to different *Use Modes*, the user has to choose a role from the *Role* combo box in the *Select Role For Execution* page.

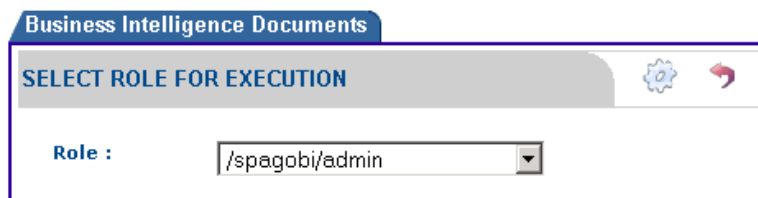

Figure 31 – Tester's documents tree

Notice that the list includes all the system roles available for the document and not only the ones belonging to the *Tester*. This means that the *Tester* will be able to test the different

behaviour of the *Analytical Document* in relation to every user's role. No matter whether he owns the role or not.

By clicking on the EXECUTION icon, the *Analytical Document* will be run and, if necessary, a page for the input parameter will be displayed allowing the user to insert the required information (from and according to the Analytical Document configuration).

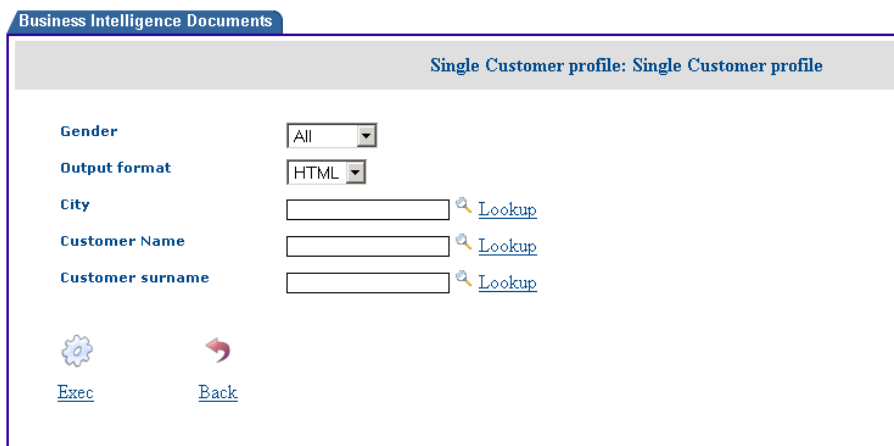

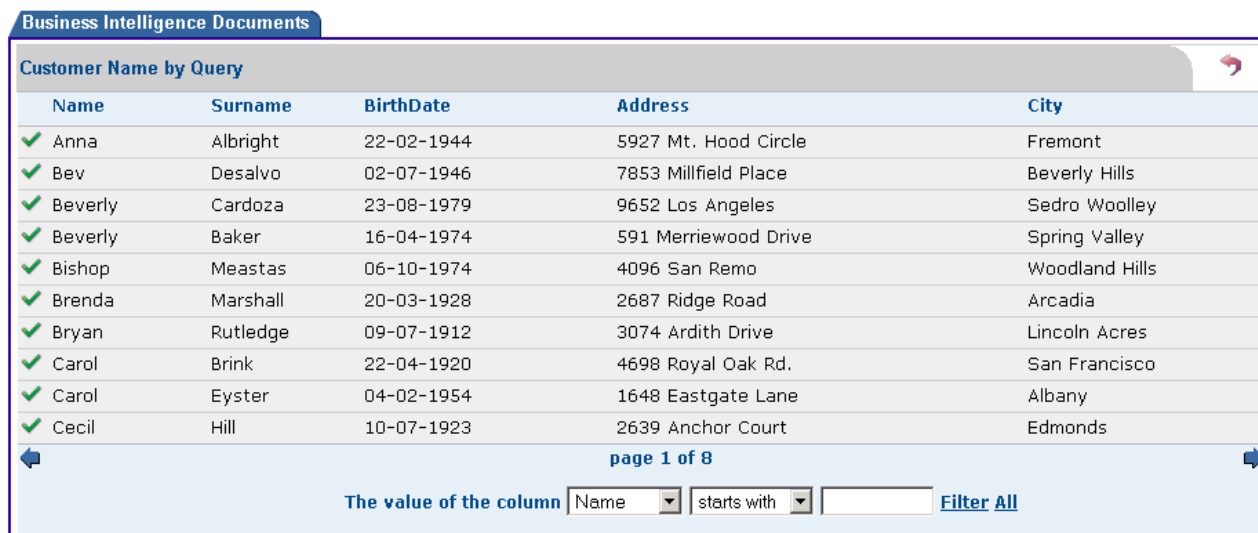

Figure 32 – Parameter page

The page is under a revision phase.

When a parameter is defined as a *Query* type, the corresponding input field becomes a *Lookup* table where you can choose your value.

Name	Surname	BirthDate	Address	City
✓ Anna	Albright	22-02-1944	5927 Mt. Hood Circle	Fremont
✓ Bev	Desalvo	02-07-1946	7853 Millfield Place	Beverly Hills
✓ Beverly	Cardoza	23-08-1979	9652 Los Angeles	Sedro Woolley
✓ Beverly	Baker	16-04-1974	591 Merriewood Drive	Spring Valley
✓ Bishop	Meastas	06-10-1974	4096 San Remo	Woodland Hills
✓ Brenda	Marshall	20-03-1928	2687 Ridge Road	Arcadia
✓ Bryan	Rutledge	09-07-1912	3074 Ardith Drive	Lincoln Acres
✓ Carol	Brink	22-04-1920	4698 Royal Oak Rd.	San Francisco
✓ Carol	Eyster	04-02-1954	1648 Eastgate Lane	Albany
✓ Cecil	Hill	10-07-1923	2639 Anchor Court	Edmonds

page 1 of 8

The value of the column starts with [Filter All](#)

Figure 33 – Lookup for parameter input value

The list pages can be turn over using the two arrows on the bottom row. The desired value can be selected by clicking on the corresponding icon. Moreover, to ease the user to find the required data, it is possible to add a filter on the list.

When the parameter selection is completed the user can execute the document by clicking on the icon.

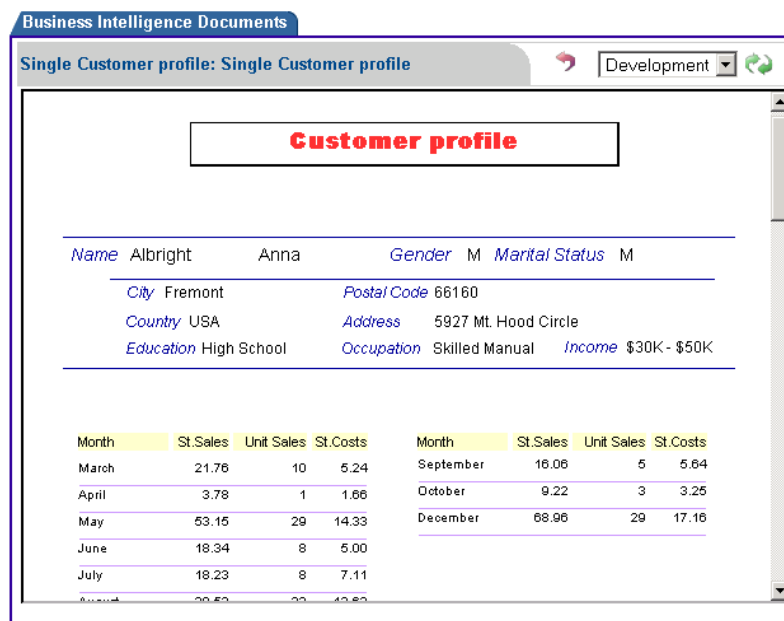

Figure 34 – Final execution

Now the test user can update the document state to *Release*, if all the required tests worked correctly; otherwise to *Development*.

Moreover, he can click on the BACK icon in order to execute a different test using a different role.

4.4 END-USER

The end-user (biuser/biuser user) works with the **Analytical Portal** made by the Business Intelligence designer and developer.

The on-line demo is an example of an analytical portal whose purpose is to let you see the basic elements for the building of your analytical portal.

For example, from the menu of the Demo portal, you can access many sections:

- **Home:** many portlets which combine punctual views of the performance indicators with synthetic reports.
- **Navigation:** a free navigation on the functional tree of the documents.
- **Instanced Reports:** a page divided into subsections for the presentation of single reports already instanced (not parametrics).
- **Parametric Reports:** a page divided into subsections for the parametric activation of the reports with default values.
- **Olap:** a multidimensional analysis model.
- **Dashboard:** a synthetic, static and dynamic presentation of historical and current series with especially interests.
- **Dynamic Dashboard:** a synthetic and dynamic presentation of the performance indicators values to be monitored at fixed time intervals.
- **QbE (Query by Example):** the module for a free and visual inquiry of the predefined data items.
- **Manual:** the user manual.

Even if the navigation portlet can run all the documents, the portal can be composed by several pages and sections: every portlet addresses a specific document, for a free

composition of the informative scene and for an immediate view of the particular business context.

Every user can use the *Released* document according to his role's visibility. When the user owns different roles and the documents have different behaviours, the role for which the document has to be executed is required.

The simple execution proceeds in the same way as the Tester's one; the only difference is that the end user cannot change the documents' state and see those in the *Released* state.

Please refer to the *Tester* section for more details about the simple documents' run.

The end user has different freedom degrees of movement and of personalization of the analysis. The modules which allow the greater freedom degree are:

- **QbE**: the user can produce and save in the repository its own interrogations;
- **OLAP**: the user can freely reorient his data model saving his more interesting view.

To be continued.

4.4.1 QbE: QUERY BY EXAMPLE

Query By Example is a SpagoBI tool realized in order to ease the user to create simple queries through a graphical interface.

Notice that this feature is in a RC (release candidate) state.

By clicking on the relative menu item, a list of the QbE queries is displayed.

Foodmart Datamart: Foodmart Datamart

The document has no parameters applied. For launch a new composition click [here](#) or on the execution button on the top-right corner.

Saved SubBIOjects

Name	Description	Visibility
QY_S01	Query for customer sales	Public

Figure 35 – QbE-Query list

On the upper side of the window the user can choose to modify an existing query, by clicking on the corresponding Execute icon, or to create a new one by selecting the *here* link at the top of the window.

The composition process is scheduled into seven steps that will ease the user to create a new query:

- **Select Fields** : to choose the **select** fields;

- **Conditions:** to set the **where** conditions;
- **Ordering:** to select the fields for the **order by**;
- **Grouping:** to select the fields for the **group by**;
- **View Query:** to display the query realized following the wizard or to write a proper query using HSQL language;
- **Save Query:** to verify if the query is formally correct and to save it;
- **Result Preview:** to display a preview of the results obtained by the query realized.

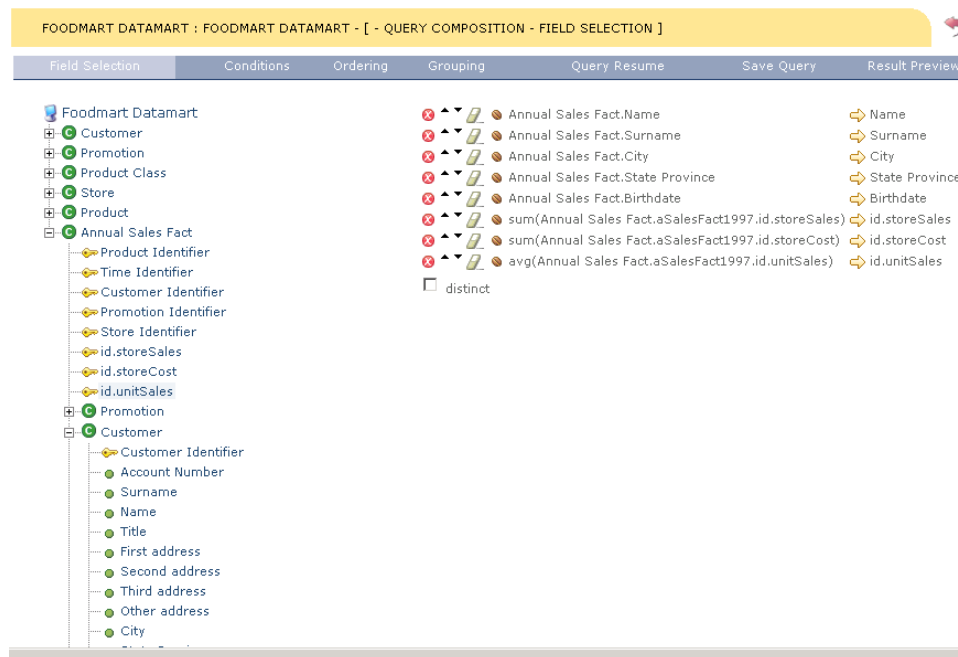

Figure 36 – QbE-Field Selection

The user can display each section simply by clicking on the corresponding tab on the title line at the top of the window.
In the following paragraphs each section will be described in more detail.

4.4.1.1 Field Selection

On the left hand side of the window a logic view of the datamart is displayed. Therefore, the user can easily navigate the tree and select the desired fields simply by clicking on them.

Figure 37 – QbE-Field Selection detail

Once selected a field, it appears on the right hand side.

The following option are available:

-  : to erase the corresponding selection;
-  : to move up or down the field in the list, to set the order of the columns of the result table;
-  : to apply a group operator on a field, by selecting the proper one from the list;
-  : to remove a group operator;
-  : to edit an alias name that will be displayed as header of the column corresponding to the selected field in the result table.

Moreover, the **distinct** option can be set by clicking on the corresponding check below the selected fields.

4.4.1.2 Condition

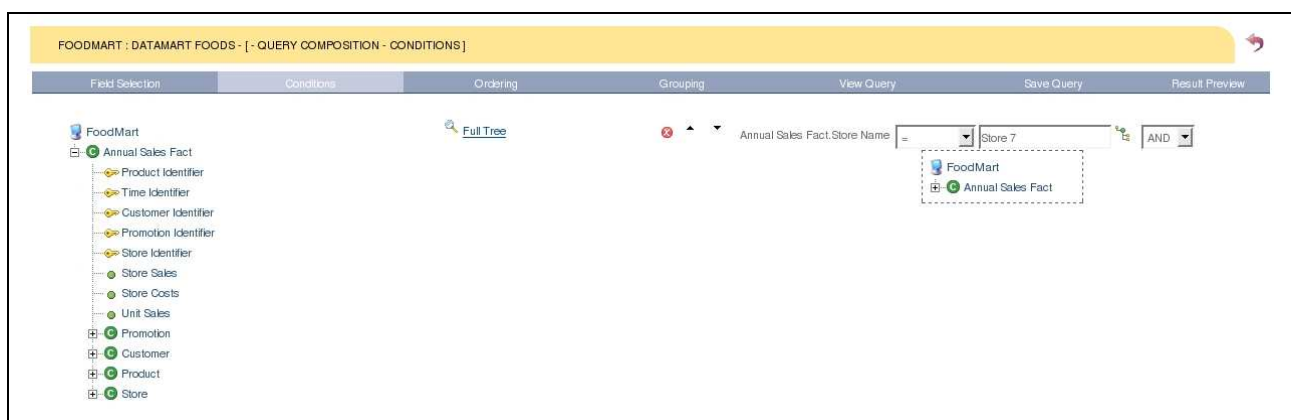

Figure 38 – QbE- Condition

On the left hand side of the window the logic view of the datamart model is displayed.

Notice that to help the user, the Qbe will display only the clauses that contain a **select field**. This is called **Light Tree**. To display the complete datamart tree, the user can simply click on the FULL TREE icon.

Once selected a field, on the right hand side of the page, the user can complete the where condition selecting the proper operator, adding the right condition in the text area and choosing the logic operator that will be set before the following condition.

Figure 39 – QbE – Where condition

Notice that the right part of the where condition can also be a field: in this case, the user can simply click on the TREE icon and select the desired field.

Notice that the datamart tree displayed is the same shown to choose the left condition.

Both the **Ordering** and the **Grouping** page display on the left hand side a list of the select fields of the query.

By clicking on the name of one of them, the user can set respectively the **order by** and the **group by** fields.

If the user tries to access one of these pages without having already selected at least a field in **Field Selection** page, the Qbe displays an error message.

Each selection can be erased by means of the relative icons:

4.4.1.3 View Query

In the **View Query** the query realized through the wizard procedure is displayed on the left hand side of the page.

Figure 40 – QbE – View Query

The user can also try to write his own query in the text area on the right hand side of the page. This is called **Expert Composition**.

The **Resume From Query** icon can be used to copy the query automatically realized by the Qbe in the text area in order to modify it.

The user can also **save the expert query** realized and **resume the last expert query** saved simply by clicking on the corresponding icons.

The two radio buttons on the bottom line of the page must be used to set if the default query to be executed is the one realized in the Qbe Automatically Composition or in the Expert Composition.

4.4.1.4 Save Query

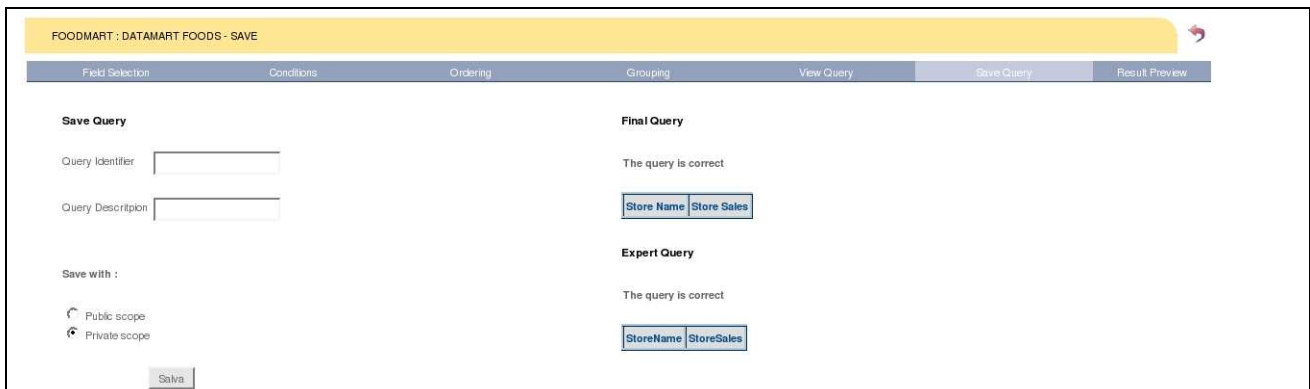

Figure 41 – QbE – Save Query

Once selected the **Save Query** tab, the Qbe will try to execute both the automatically composed and the expert query and will display on the right hand side a message to indicate if each query works properly or not.

On the other side of the page, the user can fill in the form required to save the query. The user can also specify the scope of the query:

- Public scope: the query will be visible to
- Private scope: the query will be visible to

4.4.1.5 Result Preview

FOODMART DATAMART : FOODMART DATAMART - [- QUERY COMPOSITION - RESULT PREVIEW]

Field Selection Conditions Ordering Grouping View Query Save Query Result Preview

Execution Modality ☒ Execute query composed automatically by QBE ☐ Execute query composed in Expert Mode

Page 1

Name	Surname	Store Sales
Anna	Albright	249.0300
Bev	Desalvo	155.4500
Beverly	Baker	2154.2700
Beverly	Cardoza	542.3900
Bishop	Meastas	1734.7500
Brenda	Marshall	42608.1500
Bryan	Rutledge	4195.6500

Figure 42 – QbE – Result preview

The **Result Preview** page first tries to execute the expert or the automatically composed query, depending on the selection performed in the **View Query** page.

If the query works correctly, a table containing the result set is displayed.

Otherwise, a text area containing a description of the error occurred will be displayed.

5 Getting started with SpagoBI

This chapter explains, using some examples, the single steps allowing you to enrich the demo portal with new analytical documents, by means of the SpagoBI functionalities.

First of all you have to install ExoTomcat and the SpagoBI DEMO.
How to handle the different categories of analytical documents follows.

This chapter is in revision phase.

5.1 INSTALL EXOTOMCAT AND SPAGOBI DEMO

Download ExoTomcat 1.0 from :

http://forge.objectweb.org/projects/showfiles.php?group_id=151&release_id=791

Unzip the file exoplatform-tomcat-1.0.zip but do NOT run the application, because this would cause the failure of the following SpagoBI installation.

Download SpagoBI Demo 1.0 from:

http://forge.objectweb.org/projects/showfiles.php?group_id=204

Unzip the file.

At the command shell navigate to the directory that contains the jar file obtained and type:

```
java -jar SpagoBIDemoInstaller.jar
```

Follow the instructions to complete the installation process. Notice that it will be required to specify the directory where you have previously unzipped ExoTomcat 1.0.

Once completed SpagoBI installation, at the command shell it is necessary to navigate to the temp/data/databases directory of Exo-Tomcat and type start.bat for Windows or ./start.sh for Unix: remember to check if you have the required permission for execution.

Then, at the command shell navigate to the /bin directory of Exo-Tomcat and type startup.bat for Windows or ./startup.sh for Unix.

You can read the log file by typing:

```
tail -f ../logs/catalina.out
```

5.2 REPORT

The main steps to manage a report are:

1. Create a Report Template using IReport
2. Create Parameters
 - a. Create Lists of Value
 - b. Create Constraints
3. Register the Analytical Document (the built report) into the platform
 - a. Add Template
 - b. Assign Parameters
4. Test the Analytical Document
5. Execute the Analytical Document

Notice that JasperReport is the first report engine chosen, but it is not the only one allowed. Similarly iReport is the first chosen interface for JasperReport engine but other solutions also exist and the developer can use what he prefers in order to produce the report template.

5.2.1 CREATE A REPORT TEMPLATE USING IREPORT

1. If you don't have iReport 0.5.1 you can download it from:
http://sourceforge.net/project/showfile.php?group_id=64348
2. Unzip the downloaded file.
3. Before starting iReport it is necessary to copy the file *hsqldb1_8_0_2.jar*, that can be found in the *common/lib* directory of Exo-Tomcat, in the */lib* directory of iReport. Furthermore delete the *hsqldb1_61.jar* file.
4. Now it's possible to run iReport.
5. In order to create a simple report example, select **New Document** from the **File** menu. Type *SpagoBI_Example* as Report name and click on **OK**.
From the **Datasource** menu select **Connection/Datasources**.
Click on **New** and fill in the following information:
 - **Name:** SpagoBI_foodmart
 - **JDBC Driver:** org.hsqldb.jdbcDriver
 - **JDBC URL:** jdbc:hsqldb:hsqldb://localhost/foodmart
 - **Username:** sa

Select **Save**.

6. Open the **Report query** window from the **Datasource** menu and in the **Report SQL query** text field enter the following example query:

```
select FIRST_NAME, LAST_NAME
from EMPLOYEE e, POSITION p
where p.POSITION_ID = e.POSITION_ID
and p.POSITION.TITLE='$P{EmployeePosition}'
```

This simple query will visualize the First Name and the Last Name of every employee whose position title is equal to the value of the parameter *EmployeePosition*.

7. From the **Project Browser** on the left hand side of the window, expands **Object library**. Right-click on the Project Browser and click on **Add** and then on **Parameter**. Type *EmployeePosition* in the **Parameter name** field, selecting the **Is for prompting** check box and then select **OK**.
8. It is now possible to create the report layout.
Select the **"T"** icon from the top toolbar and insert a new text field in the **Detail** area of the report. Double-clicking on the new field and in the **Static Text**, type *First Name*. Exit the properties dialog box and create another text field positioning in the **Detail** area below the first one.

Double-click on the **Fields** element in the **Project Browser** and drag the *FIRST_NAME* field next to the corresponding static text field just created. Repeat the same action for the *LAST_NAME* field.

This report will simply display a list of all employees obtained by the query.

9. Now it is possible to **execute the report** by selecting the corresponding command from the **Build** menu.

Before displaying the final result, the application will ask you to enter the EmployeePosition parameter value. You can type: "president".

5.2.2 CREATE A PARAMETER

Connect to the home page of SpagoBI portal (<http://localhost:80805/portal>) and log on using both "bidev" as username and password. This user is a *Developer* for the SpagoBI Demo and therefore you will access the *Developer Tools* page .

To **create a new Parameter** the following steps are required:

1. Predefined List of Value (LOV);
2. Predefined Values Constraints;
3. Parameters Management.

5.2.2.1 Predefined List of Value (LOV)

1. The *Predefined List of Values* page can be accessed by selecting the corresponding link from the *Developer tools* .
2. Click on the INSERT icon to add the new desired element.
3. In the *Predefined List of Values Details* page fill in the following information:
 - **Label:** Report - LOV QUERY
 - **Name:** Report - LOV QUERY
 - **Description:**
 - **Input Type:** Query statement
4. Once completed, click on the SAVE icon to save and entry the *Query Wizard*.
5. The new page displayed depends on the *Input Type* of the LOV.
In this example you will access a *Query Wizard* where it is necessary to fill in the following information:
 - **Connection Name:** dwh
 - **Visible Columns:** POSITION_TITLE
 - **Value Columns:** POSITION_TITLE
 - **Query Details:** select POSITION_TITLE from POSITION
6. Once completed the data entry, click on the Save icon saving the information and exit to the *Predefined List of Values* page.
7. Now click again on the INSERT icon to create a second LOV.
8. In the *Predefined List of Values Details* page fill in the following information:
 - **Label:** Report - LOV FIX_LOV
 - **Name:** Report - LOV FIX_LOV
 - **Description:**
 - **Input Type:** Fixed list of values
9. Once completed, click on the SAVE icon and entry the *Query Wizard*.

10. Access a *Fix Lov Wizard* where you have to add the following pairs:

- **Name:** HQ Information System
Value: HQ Information System
- **Name:** HQ Marketing
Value: HQ Marketing
- **Name:** HQ Human Resources
Value: HQ Human Resources
- **Name:** HQ Finance and Accounting
Value: HQ Finance and Accounting

Notice that usually *Name* is the field that allows the comprehension of the *Value* field.

11. When the data entry is completed, click on the SAVE icon saving the information and exit to the *Developer Tools* page.

5.2.2.2 Predefined Values Constraints

1. The *Predefined Values Constraints* page can be accessed by selecting the corresponding link from the *Developer tools*. It is divided into two parts: on the top side a list of *Predefined Constraints* is displayed; on the bottom the *Configurable Constraints*.
2. Click on the INSERT icon to access the *Constraint Details* page and create a new constraint.
3. Insert the following information:
 - **Label:** Report - Constraint
 - **Name:** Report - Constraint
 - **Description:**
4. Select *MAXLENGHT* as *Check Type* and type 23 in the corresponding text field.
5. When completed, click on the SAVE icon saving the information and exit to the previous page; then select the BACK icon to go to the *Developer Tools* page .

5.2.2.3 Parameters Management

When the required LOV and CHECK are created, a new *Parameter* can be created too.

1. Enter the Parameter List page by selecting Parameters Management from the Developer Tools page.
2. Click on the INSERT icon and open the *Parameter Details* page. Insert the following information:
 - **Label:** Report - Parameter
 - **Name:** Report - Parameter
 - **Description:**
 - **Type:** String

Click on the SAVE icon and go back to the previous page. Enter the *Parameter Details* page by clicking on the DETAILS icon in the new row corresponding to the parameter just created. Now select the PARAMETER USES icon to enter the Parameter Use Modes list which will be initially empty.

Select the INSERT icon to create a new *Use Mode*. The new page is the *Parameter Use Mode Details*. Enter the following information:

- **Label :** Report - Use Mode 1
- **Name:** Report - Use Mode 1
- **Description.**

In the *Role Association* table, select */spagobi/admin* and */spagobi/dev*.

The Administrator or Developer executing a document associated to this parameter will use this specific *Use Mode*.

Then select *Report - LOV QUERY* from the table listing all *Predefined List of Values*.

From the *Predefined Values Constraints* table don't select any constraints.

6. Now click on the SAVE icon.

It can be useful to add another Use Mode in order to understand the roles management performed by *Parameters*.

7. Select once again the INSERT icon from the *Parameter Use Modes* page.

8. Fill in the following information:

- **Label:** Report - Use Mode 2
- **Name:** Report - Use Mode 2
- **Description**

Select *Report - LOV* as LOV.

Select the *Report - Constraint* from the *Predefined Values Constraints* list.

Notice that in the *Role Association* table the */spagobi/admin* and */spagobi/dev* cannot be selected. In fact, each role can be matched at most to one *Use Mode*.

Check the */spagobi/biuser*.

9. Click on the SAVE icon to display the *Parameter Use Modes* list.

The list will display two rows each containing the main information concerning the *Use Modes* created (*Label*, *Name*, *Description* and *Number of Assigned Roles*);

10. Select the BACK icon to go back to the *Parameter List*. The *Report - Parameter* will be now displayed in the list. Notice that the *Number of Use Modes* should be 2.

Then click again on the BACK icon to reach the *Developer Tools*.

5.2.3 REGISTER THE ANALYTICAL DOCUMENT (THE BUILT REPORT) INTO THE PLATFORM

1. From the *Developer Tools* page, select the *Documents Configuration* in order to display the *Development Object List*.

2. To create a new *Analytical Document* it is necessary to select the INSERT icon.
3. In new *Document Details* page you have to fill in the following information:
 - **Label:** Report - Document
 - **Name:** Report - Document
 - **Description**
 - **Type:** Report
 - **Engine:** Jasper Report Dev
 - **State:** Development
 - **Template:** click on the *browse* button to select the report template created in the Create a Report template using IReport paragraph
4. Moreover, it is necessary to indicate which is the parent folder of the document by selecting the check box corresponding to *Static Reporting*, located as child of *Analytical Area* in the *Functionality Tree* on the right hand side of the page.
5. To save and exit from this page click on the SAVE icon.
6. The *Development Objects List* will be updated with a new row containing the document just created.
7. Now you can access the *Document Details* page simply by clicking on the DETAILS icon on the row of the new document. This page will list the general detailed information of the document. On the right side of the page a new table listing the just added template is displayed.
8. In order to set *Document Parameters* it is necessary to select the 'NEW ...' tab and add the following information:
 - **Title:** Report - Doc Param
 - **Parameters:** Report - Parameter
 - **URL Name:** EmployeePosition

Notice that the URL Name must match the name of the parameter created in the report template example in the Create a Report template using IReport paragraph.
9. When this operation is completed, save information by clicking on the SAVE icon.
10. It is possible to create a standard parameter in order to choose the output format of the document. Click on the 'NEW ...' tab and add the following information:
 - **Title:** Choose output format
 - **Parameters:** Output Type
 - **URL Name:** param_output_format

Notice that the Parameter is already present in the SpagoBI DEMO. Moreover the same parameter is used by many of the existing Analytical Document listed in this DEMO. This is an example of how to use the same resource for different document.

Furthermore, notice that the URL Name refers to a predefined parameter for the *Jasper Report* engine.

11. When this operation is completed, save information by clicking on the SAVE icon.

The new parameter will be displayed in the list.

12. Go back to the *Development Object List* by clicking on the BACK icon.

Now, all the parameters have been correctly created and configured on the *Analytical Document*. So you can execute it.

13. Click on the EXECUTE icon corresponding to the new *Report - Document*.

14. In the new page you will have to enter a value for the *Report - Doc Param*.

15. Click on the DETAILS icon and choose one of the predefined values in the list by clicking on the corresponding DETAILS icon. Select *HQ Information System*.

16. Click on the EXECUTE icon to execute the document.

17. Now it is possible to Update State by clicking on the corresponding icon at the bottom of the window. Notice that when the *Document Example* is updated, it will not be listed in the *Development Object List* anymore.

18. Logout

5.2.4 TEST THE ANALYTICAL DOCUMENT

Work in progress.

5.2.5 EXECUTE THE ANALYTICAL DOCUMENT

Work in progress.

5.3 OLAP ANALISYS

This following example is designed to quick introduce new users to create a new OLAP in SpagoBI.

The main steps to manage a report are:

6. Create a Template
7. Create Parameters
 - a. Create Lists of Value
 - b. Create Constraints
8. Register the Analytical Document (the built OLAP) into the platform
 - a. Add Template
 - b. Assign Parameters
9. Test the Analytical Document

10. Execute the Analytical Document

5.3.1 CREATE A TEMPLATE

In order to create a proper template for an OLAP document, it is only necessary to realize an XML file containing the following elements:

- `<olap>` root element;
- `<connection>` logical name that will be interpreted by the engine to identify the proper connection ;
- `<cube>` the *reference* attribute of this element identifies the XML file that describes the datamart cube using the Mondrian syntax.
- `<MDXquery>` the text of this element is a query executed on the datamart, written in the MDX syntax.
- `<parameter>` this element contained in the `<MDXquery>` identifies a parameter for the query. The *name* attribute refers to the parameter name contained in the query, while the *as* attribute identifies the alias that will be used by the SpagoBI document.

For this example it is necessary to create an XML file containing the following text:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<olap>
  <connection name='defaultDWH' />"+
  <cube reference='/WEB-INF/queries/FoodMart.xml' />
  <MDXquery>
    select
      {[Measures].[Unit Sales], [Measures].[Store Cost], [Measures].[Store Sales]} on
columns,
      {Parameter("ProductMember", [Product], [Product].[All Products].[Food], "wat
willste?").children} ON rows
    from Sales where ([Time].[1997])
    <parameter name='prdCd' as='ProductMember' />
  </MDXquery>
</olap>
```

Save the file as *productSales.olap*.

5.3.2 CREATE PARAMETERS

Connect to the home page of SpagoBI portal (<http://localhost:80805/portal>) and log on using "bidev" both as username and password. This user is a *Developer* for the SpagoBI Demo and therefore you will access the *Developer Tools* page .

To **create a new Parameter** the following steps are required:

1. Predefined List of Value (LOV);
2. Predefined Values Constraints;
3. Parameters Management.

5.3.2.1 Predefined List of Value (LOV)

1. The *Predefined List of Values* page can be accessed by selecting the corresponding link from the *Developer tools* .
2. Click on the INSERT icon to add the new desired element.
3. In the *Predefined List of Values Details* page fill in the following information:
 - **Label:** OLAP - LOV FIX_LOV 1
 - **Name:** OLAP - LOV FIX_LOV 1
 - **Description**
 - **Input Type:** Fixed list of values

4. When completed, click on the SAVE icon to save and entry the *Query Wizard*.

The new page displayed depends on the *Input Type* of the LOV.

In this example you will access a *Fix Lov Wizard* where it is necessary to fill in the following information:

- **Name:** Non Consumable
Value: [Product].[All Products].[Non-Consumable]
 - **Name:** Food
Value: [Product].[All Products].[Food]
 - **Name:** Drink
Value: [Product].[All Products].[Drink]
5. When the data entry is completed, click on the SAVE icon to save the information and exit to the *Predefined List of Values* page.
 6. Now click again on the INSERT icon to create a second LOV.
 7. In the *Predefined List of Values Details* page fill in the following information:
 - **Label:** OLAP - LOV FIX_LOV 2
 - **Name:** OLAP - LOV FIX_LOV 2
 - **Description:**
 - **Input Type:** Fixed list of values
 8. When completed, click on the SAVE icon and entry the *Query Wizard*.
 9. You will access a *Fix Lov Wizard* where it is necessary to add the following pairs:
 - **Name:** Non Consumable
Value: [Product].[All Products].[Non-Consumable]
 - **Name:** Food
Value: [Product].[All Products].[Food]
 10. When the data entry is completed, click on the SAVE icon to save the information and exit to the *Developer Tools* page.

5.3.2.2 Predefined Values Constraints

1. The *Predefined Values Constraints* page can be accessed by selecting the corresponding link from the *Developer tools* . It is divided into two parts: on the top side a list of *Predefined Constraints* is displayed; on the bottom the *Configurable Constraints*.

2. Click on the INSERT icon to access the *Constraint Details* page and create a new constraint.
3. Insert the following information:
 - **Label:** OLAP - Constraint
 - **Name:** OLAP - Constraint
 - **Description**
4. Select *MAXLENGHT* as *Check Type* and typ 35 in the corresponding text field.
5. When completed, click on the SAVE icon to save the information and exit to the previous page. Then select the BACK icon to go to the *Developer Tools* page.

5.3.2.3 Parameters Management

When the required LOV and constraints are created, a new *Parameter* can be created too.

1. Enter the *Parameter List* page by selecting *Parameters Management* from the *Developer Tools* page.
2. Click on the INSERT icon and open the *Parameter Details* page.
3. Insert the following information:
 - **Label:** OLAP - Parameter
 - **Name:** OLAP - Parameter
 - **Description**
 - **Type:** String
4. Click on the SAVE icon and go back to the previous page.
5. Enter the *Parameter Details* page by clicking on the icon in the new row corresponding to the parameter just created.
6. Now select the PARAMETER USES icon to enter the *Parameter Use Modes* list which will be initially empty.
7. Select the INSERT icon to create a new *Use Mode*. The new page is the *Parameter Use Mode Details*. Enter the following information:
 - **Label :** OLAP - Use Mode 1
 - **Name:** OLAP - Use Mode 1
 - **Description**

In the *Role Association* table, select */spagobi/admin* and */spagobi/dev*.

The Administrator or the Developer executing a document associated to this parameter, will use this specific *Use Mode*.

Then select *OLAP - LOV FIX_LOV 1* from the table listing all *Predefined List of Values*.

From the *Predefined Values Constraints* table don't select any constraints.

8. Now click on the SAVE icon.

It can be useful to add another Use Mode in order to understand the roles management performed by *Parameters*.

9. Select once again the INSERT icon from the *Parameter Use Modes* page.

10. This time fill in the following information:

- **Label:** OLAP - Use Mode 2
- **Name:** OLAP - Use Mode 2
- **Description**

Select *OLAP - LOV FIX_LOV 2* as LOV.

This time select the *OLAP - Constraint* from the *Predefined Values Constraints* list.

Notice that in the *Role Association* table the */spagobi/admin* and */spagobi/dev* cannot be selected. In fact each role can be matched at most to one *Use Mode*.

This time check the */spagobi/biuser*.

11. Click on the SAVE icon to display the *Parameter Use Modes* list.

The list will display two rows each containing the main information concerning the *Use Modes* created (*Label*, *Name*, *Description* and *Number of Assigned Roles*);

12. Select the BACK icon to go back to the *Parameter List*. The *OLAP Parameter Example* will be now displayed in the list. Notice that the *Number of Use Modes* should be 2.

13. Then click again on the BACK icon to reach the *Developer Tools*.

5.3.3 REGISTER THE ANALYTICAL DOCUMENT (THE BUILT OLAP) INTO THE PLATFORM

1. From the *Developer Tools* page, select the *Documents Configuration* in order to display the *Development Object List*.

2. Select the icon to create a new *Analytical Document*.

3. In new *Document Details* page you will be required to fill in the following information:

- **Label:** OLAP – Document
- **Name:** OLAP – Document
- **Description:**
- **Type:** On-line analytical processing
- **Engine:** Jpivot-Mondrian Dev
- **State:** Development
- **Template:** click on the *browse* button to select the report template created in the paragraph.

4. Moreover, you have to indicate the parent folder of the document selecting the check box corresponding to *Dimensional Analysis*, located as child of *Analytical Area* in the *Functionality Tree* on the right hand side of the page.

5. To save and exit from this page click on the SAVE icon.
6. The *Development Objects List* will be updated with a new row containing the document just created.
7. Now you can access the *Document Details* page simply by clicking on the DETAILS icon on the row of the new document. This page will list the general detailed information of the document. On the right side of the page a new table listing the just added template is displayed.
8. In order to set *Document Parameters* it is necessary to select the 'NEW ...' tab and add the following information:
 - **Title:** OLAP - Doc Param
 - **Parameters:** OLAP - Parameter
 - **URL Name:** prdCd
9. Notice that the URL Name must match the alias (as attribute) of the parameter created in the template example created in the paragraph.
The new parameter will be displayed in the tab list.
10. Go back to the *Development Object List* by clicking on the BACK icon.

Now that all the parameters have been correctly created and configured on the *Analytical Document*, you can execute it.
11. Click on the icon EXECUTE which corresponds to the new *OLAP - Document*.
12. In the new page you will be required to enter a value for the *OLAP - Doc Param*.
13. Select *Food* from the combo-box.
14. Click on the EXECUTE icon to execute the document.
15. Now it is possible to Update State by clicking on the corresponding icon at the bottom of the window. Notice that once updated the *OLAP - Document* will not be listed in the *Development Object List* anymore.
16. Logout

6 In more depth

6.1 PORTAL ADMINISTRATOR AND PORTLETS ORGANIZATION

Portlets are autonomous and independent application windows. They are freely usable inside portal contexts, supporting the JSR 168 specification, by means of a simple configuration. No development is necessary.

Every function in SpagoBI runs in portlets included into a corporate portal or into a particular Business Intelligence environment.

The portlet organization into the portal is realized by the Portal Administrator.

SpagoBI releases specialized portlets according to the different user typologies (administrator, developer, tester, end-user).

Each user is assigned to a specific typology by the Portal Administrator.

For a better understanding of the user typologies refer to the analytical Document life-cycle section.

6.2 ANALYTICAL DOCUMENT LIFE-CYCLE

Every SpagoBI document usually follows a three steps life-cycle:

1. **Development:** this is the proper state of every document that has to be developed, corrected, modified or improved, and, therefore, it is the initial state of every new document;
2. **Test:** it is the state of a document which has to be tested in order to check if it works correctly returning the requested result for each possible configuration;
3. **Released:** this is the state of a document that has been properly developed and tested and can be employed by the final user.

Moreover, a 4th state (**Suspended**) can be assigned to a document that will not be used anymore.

Referring to this life-cycle, SpagoBI users can have a specific function which is assigned by the portal administrator.

Users can be classified in 4 different typologies:

1. **Administrator:** he deals with configuration and security aspects.
2. **Developer:** this type of user can create or modify documents;
3. **Tester:** he takes the responsibility to verify the formal correctness of the registered documents and if they fulfil the requirements.
4. **User:** he can use all the business objects in a 'released' state, according to his role and with the modalities previously defined in the parameters configuration.

The *User* is characterized by his functional roles, which regulates:

- the analytical documents visibility;
- the visibility of the data shown by documents;
- the behaviour rules of their parameters and the filters.

It is very important to notice that administrators, developers and testers are also users and, therefore, they can act as specialised users with additional functions.

Figure 43 User type hierarchy

Every user will access a specialized main page that will contain specific tools.

When completed his own phase, a Developer can update the document state to Test, while a Tester, referring to test results, can change it to Development or to Released.

The administrator is the only one who can modify a document state without any constraints allowing extraordinary maintenance of the documents.
Notice that the simple user cannot modify the document state.

Finally, it is important to observe that in order to develop, test or execute a particular document, it is necessary to have specific rights which can only be assigned by the administrator. For a better understanding of the Security Policy please refer to next paragraph.

6.3 USER ROLES

Every user is characterized by one or more functional roles.
SpagoBI manages users by their functional roles in order to regulate:

- the analytical documents visibility;
- the visibility of the data shown by documents;
- the behaviour rules of their parameters and the filters.

6.4 DOCUMENT ORGANIZATION AND SECURITY POLICY

SpagoBI sorts documents in a "Functionality Tree" which is a File System that can be modified only by an administrator user.

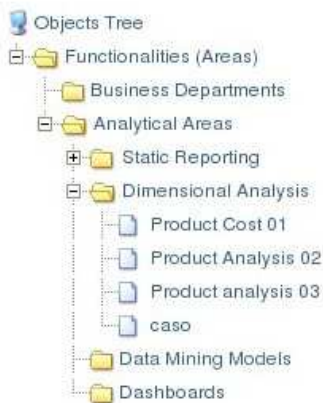

Figure 44 Functionalities Tree

This allows to better organize documents, grouping them by folders, and to realize a Security Policy. In fact, a user can develop, test or execute a document only if he has at least one role belonging to the corresponding permissions on the folder containing it.
Only an administrator user can set these authorizations for each role and each folder.

For instance, in order to develop a document it is necessary:

- 1) to be defined as *Developer* by the portal administrator;
- 2) to have at least a role that belongs the *Development* rights on the folder that contains the document.

To execute a document it is required to:

- 1) to have at least a role that belongs the *Execute* rights on the folder that contains the document.
